ABSTRACT

This issue of Impact is devoted to paraprofessionals in the helping professions and develops the discussion through five major articles. Part 1 offers an introduction to the role of paraprofessionals in classrooms and pupil personnel services. Part 2 relates the historical and legislative developments of paraprofessionals in the mental health fields and education. The selection, training, supervision, and evaluation of nonprofessional personnel, as well as problems often associated with their use, provide the focus for section 3. The discussion in part 4 centers on 14 model programs showing how paraprofessionals have been successfully employed in a variety of settings. Concluding section considers the effects of the use of paraprofessionals on the paraprofessionals themselves and on professionals, students, and administration. Possible future developments in the paraprofessional movement and their implications for the field of counseling are also discussed. Regular Impact features include Quotes, Flashes, Research Findings, and New Resources. (Author/PC)

Support Personnel in the Helping Professions: a Major Article in Five Parts

by Libby Benjamin
Sherry Davidson
Wendy Suss Kadushin

Part One: Introduction and Overview 8

An introduction to the role of paraprofessionals in classrooms and pupil personnel services is presented along with a brief exploration of the relationship between professional and paraprofessional workers.

Part Two: Background and Development 14

Historical and legislative developments relating to paraprofessionals in mental health fields and education are covered in this section. The authors also describe a few model programs involving paraprofessionals and discuss the rationale behind them.

Part Three: Guidelines for Using Paraprofessionals 23

The selection, training, supervision, and evaluation of non-professional personnel, as well as problems often associated with their use, provide the focus for this section. Examples of training programs are provided to illustrate this important process.

Part Four: Paraprofessional Programs in Human Services 30

This discussion of 14 model programs provides several examples of how paraprofessionals have been successfully employed in a variety of settings, including school, university, and community-based programs.

Part Five: Present Implications and Future Trends 42

The effects of the use of paraprofessionals on the paraprofessionals themselves and on professionals, students, and administration are explored in this section. Possible future developments in the paraprofessional movement and their implications for the field of counseling are also discussed.

Quotes

[On euthanasia] There's no single rule you can apply. For me it is always an intensely personal, highly emotional, largely unconscious, quasireligious battle. I have never said to myself in cold analytic fashion, "Here are the factors, this is the way they add up, so now I'm going to pull the plug." Yet I and most doctors I know have acted in ways which would possibly shorten certain illnesses — without ever verbalizing it to ourselves or anyone else.

Richard Kessler, M.D.
Associate Dean
Northwestern U. Medical School

Paranoia is a state of heightened awareness. Most people are persecuted beyond their wildest delusions. Those who are at ease are insensitive. Depression is alienation due to the mystified oppression of our capacity to love. So-called schizophrenia is alienation due to the oppression of people's awareness.

The Radical Therapist
Manifesto

We can be said only to fulfill our destiny in the place that gave us birth. I should on this account like well enough to spend the whole of my life in traveling abroad, if I could anywhere borrow another life to spend afterwards at home!

William Hazlitt
Table Talk

What is clear to me, is that the National Institute of Education cannot be an institution devoted only to fundamental research. It must be deeply concerned with practice. It must find ways that seemingly do not now exist to communicate with practitioners. Of course, it is crucial that it have knowledge that is worth communicating.

Thomas Glennan
Director N.I.E.
Education Daily

People with personal problems often behave like the proverbial drunk who looks for his house key under the streetlight, not because that's where he dropped it but because that's where the light is. Should such a person consult an autonomous psychotherapist, the therapist's job is not to try to find the key but to suggest to the "patient" that he light a match or borrow a flashlight from a neighbor and go look for his key where he dropped it.

Thomas Szasz, M.D.
The Second Sin

I don't believe in goals. Life isn't a 100-yard dash or a basketball game. Everybody's got hundreds of goals. But maybe I ought to sit down and decide on a goal before I die. I've always believed in amelioration. But it's not a goal; it's more a philosophy.

Dr. Karl Menninger
on his 80th birthday

Through further counseling, the couple began to discover sex in and of itself had no curative effects on other marital difficulties. It did, however, put them in a better frame of mind to look at the problem areas and find solutions. John and Alyce have a better marriage today and are pleased especially with their own ability to change in constructive ways.

A year and a half after his vasectomy, John reflects back on what his urologist told him, that having a vasectomy was "no more painful than having a tooth pulled."

"That's true," John says, "all of them at the same time."

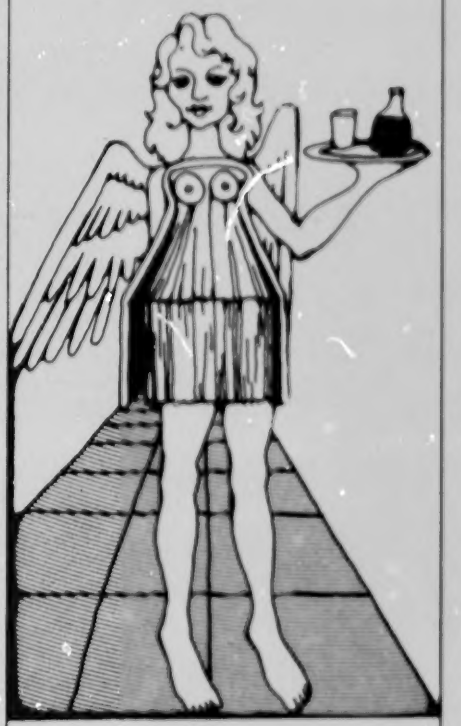
Edward Staniec
Detroit Magazine

Our enthusiasm was not derived from reading persuasive reports or theories. It is rather based on the pleasurable experiences which follow from our efforts to help families. The fact that these experiences are so readily translated into data is an additional source of reinforcement.

Gerald Patterson
Professor of Education
University of Oregon
Unpublished paper

I am not really a man of science, not an observer, not an experimenter, and not a thinker. I am nothing but by temperament a *conquistador* — an adventurer, if you want to translate the word — with the curiosity, the boldness, and the tenacity that belong to that type of being.

Sigmund Freud



Man is willing to accept woman as an equal, as a man in skirts, as an angel, a devil, a baby-face, a machine, an instrument, a bosom, a womb, a pair of legs, a servant, an encyclopaedia, an ideal or an obscenity; the one thing he won't accept her as is a human being, a real human being of the feminine sex.

D. H. Lawrence
Assorted Articles

Oh, the comfort, the inexpressible comfort of feeling safe with a person, having neither to weigh thoughts nor measure words, but pouring them all right out just as they are, chaff and grain together, certain that a faithful heart will sift them, keep what is worth keeping, and then with a breath of kindness blow the rest away.

D. M. Craik

Flashes

Gary Shapiro crawls into a cage at Roeding Park Zoo in Fresno, California every weekday morning and trades fruit slices for plastic letters with an orangutan.

Shapiro, 22, a graduate student at Fresno State University, "talks" with the 5-year-old female ape, Azak. Azak has learned, perhaps by rote, perhaps by association, that the different shaped plastic pieces handed her mean food if she can get them in a certain order.

"It is the relationship between a symbol and an object," Shapiro explained. "Azak has learned that if she wants a slice of orange, for instance, she first must hand me the letter 'Q' then the letter 'E.' If she wants a piece of apple, she must hand me the letter 'A.' Very rarely does she make a mistake and hand me the letter 'T,' because by now she knows full well I'll take something from her. . . . It may just be that by working with an orangutan, some method of teaching a mentally retarded child may evolve," Shapiro said. . . .

Women entering on-job apprentice programs in the skilled crafts and trades did as well as or better than men and remained in the labor force longer, according to witnesses testifying before the U.S. Commission on Civil Rights in Chicago.

In the last two years, 200 women have been placed in 22 construction trades through a federal pilot program in Denver. The women who have been placed by the program, which is designed to put female heads-of-households in higher paying jobs, earn an average starting salary of $4.06 an hour. . . .

The Bennington, Vermont, Board of Education upheld the cancellation of a subscription to *Ms.* Magazine for the high school library. A special review board had voted to cancel the subscription after parents of students complained about language in an excerpt from the Erica Jong novel, *Fear of Flying*.

The publisher of the magazine, Patricia Carbine, and the editor, Gloria Steinam, both protested the move, saying it is a violation of the Constitutional rights of students to choose their reading material and shuts them off from the "beautifully diverse truth" of female existence. . . .

The National Education Association reports that 37% of the nation's public school teachers were victims of violence in 1971-72.

Two percent say they were attacked by students, and 9% say their personal property was maliciously damaged by students. Violence against teachers is more widespread at the secondary than at the elementary school level. Fifty-two percent of secondary teachers, compared with 23% of elementary teachers, report attacks on teachers or damage to their property. In school systems with enrollments of more than 25,000, one teacher in 25 reports having been attacked by a student. . . .

Worried about exams? Uptight about being called on in class? Afraid of speaking in front of large groups? At Cornell the dean of students has started a new program to reduce — and resolve — these and many other common student problems. The new plan, called the Academic and Social Anxiety Program (ASAP), emphasizes "systematic desensitization." Students first are taught to identify the sources of their anxiety (some are afraid of dogs, others can't stand the idea of flying home for Christmas), and then, with the help of audio tapes, they are taught how to relax muscles throughout their bodies. After a few months they can relax without the tapes — and they're on the way to recovery. The program was so successful last year (some 30 students were systematically desensitized in individual sessions) that it is now being offered to groups. . . .

At the University of California, Berkeley, where about three students commit suicide each year, Dr. Richard H. Seiden describes the major factors as "worry over schoolwork, chronic concern about physical health, and difficulties with interpersonal relationships." He adds that females are more likely to attempt suicide than males, but males are more likely to succeed. Dr. Seiden, an associate professor of behavioral sciences who has made several studies of student suicides, says that in most undergraduate cases the suicide victim has better than average grades, although the reverse is true among graduate students. . . .

No one goes to school on Fridays in Unity, Maine, school district No. 3. The four-day week began as an effort to cut costs and increase teacher planning time. Funded by Title III (ESEA), the program sets aside Fridays for faculty workshops and other unstructured educational experiences. Teachers, students and parents are enthusiastic about the results which provide a more leisurely pace for learners and instructors. A study of achievement scores by the University of Maine found that learning levels of the students had increased by decreasing the amount of time spent in school. . . .

Ralph Kelly, president of the Association of Child Care Workers, notes that the teacher surplus has had a good impact on the field of institutional child care providers. Men who were unable to get jobs in classrooms have entered the child care field and found they liked the work. They are especially needed to provide a balance of care for orphaned and delinquent children. Also, the increase in the number of men in the field has increased the pressure for higher pay, which will benefit everyone. . . .

Question: what do beer and referral services have in common? Answer: bartenders. At least in Racine, Wisconsin. In that city, several bartenders have recently received diplomas from the Racine County Mental Health Association in a new program to teach them how to help disconsolate patrons.

The idea grew out of studies showing that ministers and bartenders have the most contact with inner city residents.

The tapsters, according to program director Ruth Wayland, are taught how to listen and are given knowledge of where people with financial, medical, or personal-social problems can go for help.

Science Scores Down

The National Assessment Education Progress group (NAEP) issued a brief report finding science achievement scores among the nation's youth has declined since 1969. Science was the first area to be surveyed by the group which will issue a more detailed report in early 1975. NAEP major findings to date show:

- On most exercises measuring science knowledge and skills, achievement declined at all three school ages assessed — 9, 13 & 17.
- On exercises used on both assessments, national performance improved on about one-third of the exercises and declined on about two-thirds.
- At the three school age levels, the size of the decline in performance was between one and two percentage points, enough of a drop to fall outside the margin of error allowed in the statistical analysis of the assessment results.

Copies of the report are available from the Education Commission of the States, Suite 300, 1860 Lincoln St., Denver, Colorado 80203 for $2.00 per copy.

Educational Passports

A trial system of putting personal resumes on microfiches is being conducted by the Educational Testing Service (ETS). The project is titled "Educational Passports," and ETS is receiving a $100,000 grant from Lilly Endowment, Inc. to test the practicality of such an idea. The passports will be the creation of the individuals themselves who can construct and control everything which goes on the fiche, which will act as personal resumes for prospective schools or employers. ETS will work with the College Entrance Examination Board in refining the passports. Subjects for the project will be 2,000 individuals in high school, college, and commercial settings. ETS hopes to launch the service in Fall 1975.

NASP

Advice on planning, training, and other aspects related to establishing alternative schools is provided by the National Alternative Schools Program (NASP). This project, begun in 1971 and funded by the U.S. Office of Education, offers experience and expertise to school systems throughout the United States, especially minority communities. For further information write: NASP, School of Education, University of Massachusetts, Amhurst, Mass. 01002.

Self-Supporting Student: CCS Topic

The 20th anniversary conference for the College Scholarship Service of the College Board was held in Dallas/Fort Worth earlier this year. In attendance were students, educational administrators, State education commission representatives, grant and loan administrators, College Board and Education Testing Service staff, and members of the press. Their focus was on the problems surrounding the self-supporting student. Who benefits? Who pays? Ever since the passage of the 26th amendment, which lowered the voting age from 21 to 18, educators have become concerned with the issue of students claiming independence from their parents as part of their application for financial aid funds. At the conference the social, psychological, legal, and financial implications of this problem were discussed. The formal proceedings of the conference will be published and distributed by CCS. Availability of the proceedings will appear in The College Board *News*.

Where the Deer and Antelope Play

In Wyoming those plains creatures so often sung about in Western odes and ballads are common sights. However, elementary school children in one small

Wyoming community are concerned about the future of wildlife in their state. These children are seeing many of their native fauna being killed for pelts or dying for lack of food. At the elementary school in the tiny southeast Wyoming town of Rock River, third and fourth graders asked their teacher, Mrs. Florence Atkinson, if they could express their concern about wildlife. The letters they wrote discussed eagle and coyote killing, the problems with brucellosis in buffalo herds, the treatment of wild horses and the killing of some bears in Yellowstone National Park. Their letters were mailed to the Wyoming Game and Fish Department and appeared in an issue of "Wyoming Wildlife" published by the department.

Panel on Peer Counseling of Sex Problems

The Student Coalition for Relevant Sex Education, with the permission of the New York Board of Education, initiated a pilot program in peer counseling of high school students on sex matters. Their project was financed by a $175,000 grant from the Ford Foundation. The counselors, all of whom volunteered for the program, were trained in basic sex information and counseling techniques by Planned Parenthood, the Human Resources Administration Family Planning Unit, faculty from New York University and Hunter College, social workers from the Human Resources Administration, and the Community Council of New York.

The counselors were given 14 weeks of training, including how to give out information, how to help students to ask questions without embarrassment, how to keep all revelations confidential, and how to refrain from making judgments about the morality of the students' conduct or using language which would tend to indicate a moral judgment. A faculty advisor, chosen by the principal with the recommendation of the counselors, sponsored the student rap room, the site of the counseling sessions. This faculty advisor was alone responsible for making referrals of students to suitable agencies or medical services.

The student response to this program was very positive. They cited knowledge of contraceptives, venereal disease, and the availability of clinics and programs as urgent gaps in their sex education. Students were also confused by emerging sex roles and the relation between self esteem and sexual expression. These findings were reported by a student panel at a meeting in Washington, D.C. of the American Association of Sex Educators and Counselors.

Public School Crime in New York City

Yearly figures of various crimes and public misdemeanors committed on public school property are reaching increasing proportions. The New York City school system, which only recently began counting what it calls "incidents", recorded almost 5,000 for the 1973-74 school year. Such statistics indicate that juvenile crime in the schools is an increasingly serious problem. Yet, schools are almost powerless to control these offenses. They are caught in the middle of trying to reconcile, singlehandedly, conflicting demands between advocates of law and order vs. children's rights. Law and order partisans want troublemakers to be removed, and an aura of learning restored to the classroom. Children's rights partisans stand against the idea of isolating or confining troubled students.

Jeremiah McKenna, general counsel of the New York State Select Committee on Crime, proposes one solution to this problem through close and confidential communication between the Family Court and the public schools. Barbara Blum, the city's former Commissioner of Special Services for Youth, takes an alternative view that sees a need for radically improved services to the neediest children and their families since present services and facilities are grossly inadequate. Other critics point to family and community breakdown, mass violence on communication media as prime sources of influence in juvenile crime. Nevertheless, no single agency has proposed a solution which is satisfactory to all. Their debates only help educators realize that juvenile justice and how to solve its abuse is not limited to one particular institution, school, or law enforcement agency.

No Longer a Minority Group — Eighteen-Year Olds

Ohio's State Education Agency has taken steps to deal with full-fledged adults in the classroom. According to Martin Essex, Superintendent of Public Instruction, Boards of Education have a statutory duty to make reasonable rules for governing pupils, even 18-year olds. "The courts have traditionally held that rules of a Board of Education will be sustained as long as they are reasonable and not arbitrary or capricious," he stated. Mary Lentz, the state department's attorney, has developed guidelines for the interim until legal decisions provide administrators with governing principles. Simple changes in language will result in some guideline alterations. For example, if the term "child" is used in the school or district regulations, the substitution of the term "pupil" now appears advisable. Essex noted that one section of the Ohio Revised Code requires parents to continue supporting an 18-year old as long as he or she goes to school. The code section states: ". . . Parental duty of support to children shall continue so long as the *child* continuously attends on a full-time basis any recognized and accredited high school, even when such *child* has attained the age of majority." (It appears that not all sections of the Revised Code have been edited for the word change from "child" to "pupil.") Another section of the revised code provides that compulsory school attendance ages remain 6 to 18.

research findings

When things get out of hand in the classroom, the teacher needs more than reassuring words — she needs help. Classroom management techniques take a variety of forms, and study examined two of them: (1) an approach which sought to praise appropriate behavior and ignore inappropriate ones; and (2) an approach which first introduced a model of the behavior sought and then encouraged imitation of the behavior through reinforcement. Fifth and sixth graders from 12 classroom settings in five schools, who were behavior problems, were selected for the study which lasted 10 weeks and was observed by a committee of trained observers. Results show that on-task behaviors of these

youngsters can be modified through both approaches, but best results accrue when the two approaches are combined. Those working with distractible children must first learn what turns them on — in order to tune them down.

Southern Journal of Educational Research, v8 n3, p182-191

When to be serious or when to be funny — that is a problem in any relationship. To investigate whether or not humor could be used as an effective ice-breaker in an interview situation, three groups of counselees participated in a study. Group I was exposed to humor by means of reading and rating a group of cartoons prior to the actual counseling session. Group II rated simple design patterns. Group III used the waiting time as they chose. Each subject was subsequently involved in a counseling interview following which he completed a short form of the Relationship Questionnaire which is designed to measure client perception of the counselor-client relationship. Significant differences were discerned in the scores of the different groups, with those clients in Group I giving the counseling interview considerably higher ratings than those in the other groups. While helping persons may not exactly be able to laugh their way to effective counseling, they can establish better rapport with clients with a light touch of humor. So the next time you have an interview you can start with, "Have you heard the one about - - -?"

Dissertation Abstracts International, v34 n7 p3875-A

How much information should be available to school personnel through a student cumulative record? A research study sought to determine the effect that the juvenile delinquent label had on teacher expectations. To this end, four fictitious cumulative folders were constructed, two of which contained the delinquent label. All other folder items were weighted equally with the characteristics of delinquency-prone students as found in delinquency research. Equal numbers of blacks and whites were labeled as delinquents and not labeled at all. Teacher responses indicated that they significantly lowered their expectation for all labeled students. Teacher bias was not a factor, and label-race of student was not significant. If you have to be legally 'bad', at least try to keep it out of your school record.

Dissertation Abstracts International, v34 n6 p4746-A

College freshmen have been studied *ad infinitum*, but traditional methods of evaluation do not always work with everyone. In a study of the effectiveness of traditional methods of evaluation (high school GPA's and SAT scores) and subjective methods (self, peer, parent, counselor, and teacher perceptions), in predicting the academic performance of disadvantaged college freshmen, traditional methods have proved inadequate. Among subjective methods, peer prediction was significantly related to the academic performance of the freshman group. Another study finding was that the more hours disadvantaged students attempt, the higher their achieved GPA, refuting the assumption that they perform better with reduced class loads.

As always, educators should know the population group with which they are working, and use those methods which work best for those people.

ED 087 954

If your older sibling didn't make it with Ms. Jones in third grade, you'd better not get stuck with Ms. Jones when you get to third grade! A study was made of 79 pairs of siblings who had completed the same grade in the same school. The older children were classified as high or low performers on objective measurements; neither they nor the teachers involved were aware of the study. Marks and scores of younger children were compared to those of their older siblings. Where both had had the same teacher, the younger child was placed in a high or low expectancy group, depending on older sibling performance. If the two had different teachers, the younger child was put into the control group. Analysis of results supported the teacher expectancy hypothesis — when the older had done well, the scores of the expectancy youngsters were higher than those of the control group; when low, expectancy group scores were lower than controls on all but one test.

While the effect of positive teacher expectation on sibling performance is certainly acceptable, the effect of negative expectation causes deep distress since it may be preventing youngsters from attainments of which they are otherwise capable. This problem is of particular concern where a choice of teacher is not possible for younger siblings.

Behavior Today, Feb. 11, 1974

With college enrollment falling and with dormitory rooms a drag on the market on many campuses, college administrations are extremely concerned with offering the type of accommodations most palatable to students and to their continuation in school. A study investigated new freshmen living in various types of dorms, and compared them on several dimensions: academic achievement, attrition from the university, responses to a University Student Census, cost of damage to buildings, and number of reported incidents such as theft, vandalism and disturbances. Dorm arrangements studied were: (1) coed vs. single-sex dorms; (2) high rise vs. low rise; and (3) limited vs. unlimited visitation hours. No significant differences were found among residents of different dorm types of achievement or attrition; some differences were found on Census responses. Coed and male dorms reported more damage and incidents than female dorms; high rise dorms reported more damage and incidents than low rise dorms; and limited visitation hours dorms reported fewer incidents but higher damage cost than unlimited hours dorms.

If a college wishes to provide alternative dorm arrangements, it cannot be influenced by the effects of living style on achievement and continuation in school. If it wishes to provide the "safest" pattern of housing, it will offer only female, low-rise dorms with no visitation hours!

ED 082 640

How you look at things makes a difference, right? Not always! Groups of elementary students were tested on items which were arranged in a hard-medium-easy order, and easy-medium-hard sequence. Regardless of context, test scores were the same, although youngsters did perceive items arranged from hard to easy as being easier than those same items arranged the other way around.

The "eyes" may have it, but in the final analysis, the head wins out.

ED 090 462

The age-old argument between nature and nurture still goes on. A recent study sought to test the hypothesis that, while normal slum children raised by retarded mothers evidence low IQ's themselves, they show normal or better IQ's when nurtured in a more positive atmosphere.

Through a seven-year federally-funded project, 40 inner-city black babies whose mothers had below 75 IQ's were divided into two groups — control and experimental. The latter spent five days (seven hours daily) a week at a preschool where specially trained personnel provided them with good food, good mothering and a great deal of conversation and exploration. Results of regular testing showed that, while only three of the control group have reached IQ scores of over 100, the average IQ in the experimental group is 123. (The study children are presently starting school and doing well, although final success cannot be judged until they are tested after the second or third grade. It is possible they may slip, removed from the special nurturing environment.) It would seem, once more, that a very strong case is made for the preschool development of children. By the time they reach first grade, it may already be too late to alter patterns developed — or left undeveloped.

Learning, v2 n8 p56

Children are naturally sensitive and accepting of other children, right? Not necessarily, according to a study that examined children's reactions to a variety of behaviors indicative of emotional imbalance. Boys and girls (n=326) in the upper elementary grades reacted to descriptions of imaginary peers of the same sex. Five descriptions were of disordered personalities while one was normal. The study youngsters viewed the disturbed peers as unattractive, expressed negative attitudes about associating with them, and regarded them as different from themselves. It would appear that study subjects do not wish to seem similar to those whom they regard as disturbed. Children adopt attitudes similar to those of adults — negative as well as positive. Parents, take note!

J of Consulting and Clinical Psychology, v 42 n 3 p 462

Speak softly and carry a big stick, or yell loudly enough — either way you are likely to make your point. Using a grouping of 900 recorded counselor statements previously rated by judges on their degree of persuasiveness, the researcher evaluated the 24 highest rated persuasive and 15 lowest persuasive statements, using an electrical measuring device which fed into a graphic recorder. It was found that those statements rated persuasive were louder than those rated less so. Apparently, conviction encourages counselors to speak with greater force than they otherwise might do. No wonder arguments get so heated — everyone is convinced he's right, so everyone yells! We'll all need earmuffs!

J of Counseling Psychology, v21 n2 p1-2

Oscar Wilde, in *The Picture of Dorian Gray*, said, "A cigarette is the perfect type of perfect pleasure. It is exquisite and it leaves one satisfied. What more can one want?" The Surgeon-General's Office has a notice on every pack of cigarettes that tells people of the possible health dangers involved in smoking. What is there about reasonably intelligent people that makes them continue to indulge in something they acknowledge is harmful? Alan Berman of the American University studied two characteristics related to smoking — locus of control and death anxiety. Data were gathered from 300 students (mean age, 22) through five questionnaires which assessed their smoking habits and demographic information, locus of control, death anxiety, attitudes toward death, and belief in an afterlife. The only significant correlation occurred between smoking and education: the more highly educated smoked more. The most frequently used rationalization was "the pleasure outweighs the hazards."

Berman concludes from his study that a future death threat is not sufficient to make people give up smoking. Regardless of what people know on a conscious level about cigarette smoking, they seem willing to continue to smoke because they enjoy it. Small wonder that behavioral approaches do not work when participants do not really want to change their behavior.

Behavior Today, March 4, 1974

"Dropout prevention receives highest emphasis at the secondary level; however, indications are that dropouts are 'formed' in first grade and nurtured until high school when they actually leave the system. A study was conducted in Philadelphia on the records of 50 students who had dropped out and 50 who had entered college. Not unexpectedly, dropouts had lower IQ's, poorer grades, worse behavior ratings and higher absenteeism than non-dropouts. What was unexpected was that all these patterns had existed at grade one, and had merely been exacerbated through the years. If dropout-prone students can be adequately identified during their first year in school, we should be able to apply remedial techniques early enough to alter the pattern, thereby reversing the tendency toward failure."

Human Behavior, v3 n3 p30

Editorial Note

Impact frequently reprints statements that represent provocative, if not extreme, views as a means of sensitizing readers to important issues or developments that are relevant to the work of those with helping responsibilities. Occasionally, these statements may seem to contain political references or to have political connotations. We wish to emhasize that neither by design nor intent does *Impact* take stands on political issues or questions or evaluate political figures. The basis for inclusion of items is determined solely upon the utility of the information for the performance of professional responsibilities and activities and any attempt to draw inferences regarding political views is inappropriate and unwarranted.

P.O. Box 190
Arlington, Virginia 22210

To order any of the ED materials, the following information must be furnished: The ED number of the document; the type of reproduction desired—paper copy (HC) or microfiche (MF); the number of copies being ordered. All orders must be in writing. Payment must accompany all orders and must include postage (18¢ for up to 60 microfiche or the first 60 pages of paper copy, and 8¢ for each additional 60 fiche or 60 pages). Residents of Virginia should pay the appropriate sales tax or include a tax exemption certificate. The new turnaround time for filling orders is 5-7 days.

1.
INTRODUCTION & OVERVIEW

Introduction

The paraprofessional concept represents an effort to expand, humanize and personalize a number of professional services. The paraprofessional or nonprofessional is a noncredentialed worker who performs either the same or similar tasks as the professional, functioning in various capacities within a wide variety of settings.

Attempting to define the role of the professional and determine the parameters of the role of the paraprofessional is a topic that has been frequently written about and widely debated in recent years. The use of personnel who are not fully qualified as professionals but who perform many of the tasks that were formerly the sole responsibility of professionals is well known in social work and health services. Hospitals, welfare agencies, mental institutions, settlement houses, in-patient clinics and convalescent homes have long employed nonprofessionals for custodial care and for the simpler, more routine duties which require little training or education except that which can be provided on the job. Paraprofessionals have also functioned for a number of years in the classroom, and their presence and help have enabled teachers to assume more the role of manager of the learning environment and designer of the educational program than simply the agent of instruction. The development of the role of the paraprofessional counselor, however, has been the cause of a dilemma, perhaps because the role of the professional counselor is still emerging and counselors are apt to view nonprofessional participation in counseling functions as a threat to the profession. Because the controversy concerning the use of paraprofessionals in recent years has centered on the area of pupil personnel services, the primary focus of this issue will be directed toward the use of nonprofessional personnel in counseling and guidance, with some attention given to their employment in other settings.

The main purpose of this publication, then, is to investigate the role of the paraprofessional counselor, reviewing the factors that have led to the emergence of the need for such persons; examine a number of programs that utilize the services of nonprofessional guidance personnel; suggest some guidelines that research suggests are important in selecting, training and evaluating paraprofessionals; discuss the effects on professionals, institutions, and the persons themselves of their employment as workers in the counseling field; and take a look at the future of the paraprofessional movement in pupil personnel services.

Because the paraprofessional movement in counseling derives its origins from many of the same forces which brought aides into teaching and mental health settings, this issue includes a brief history of the background and development of those fields as well. It is believed that an exploration of the mainsprings of the paraprofessional concept in general will contribute meaningfully to the understanding of its specific application to pupil personnel services.

Paraprofessionals in pupil personnel services are nonprofessional individuals, not including the secretarial staff, who assist with guidance activities. Such individuals have also been referred to as nonprofessionals, subprofessionals, support or auxiliary personnel, aides or assistants. The kind of persons who perform paraprofessional roles in counseling and personnel programs, as well as in other professional settings, varies tremendously. Such nonprofessionals may be parents, students, community volunteers, or lay persons with varying levels of experience; they may come from the ranks of the very poor or the upper classes; they may be college graduates or elementary school dropouts; they might be of any ethnic origin. In addition, the functions performed by these persons vary with the design of the program in which they are employed and may range from reviewing data to performing one-to-one counseling services.

Paraprofessionals are employed to provide a service without regard to certification or previous educational attainment, and are thus considered nonprofessional workers. The term "nonprofessional," however, does not

mean "unprofessional." Although not officially certified or highly educated, the paraprofessional in any profession may carry out his or her responsibilities in a completely professional manner. Therefore, when used in this publication, the term nonprofessional is meant to be synonymous with the term paraprofessional.

The nonprofessional or paraprofessional is usually in contact with or under the supervision of a credentialed professional, and his or her addition to the staff often means an alteration in the traditional professional role. As a result of a number of factors — including the orientation of the professional staff to the program, the role assigned to the paraprofessional, the facility with which the aide performs that role, and the attitudes of existing professional staff toward the newcomer — the paraprofessional may be viewed as a strong asset or a threat to the credentialed professional. An attempt will be made in this issue of *Impact* to explore the relationship of the paraprofessional to the professional and to assess the effects of that relationship on the persons involved.

This review is not an attempt to praise or promote paraprofessionalism in counseling services; rather, it is an attempt to examine the paraprofessional movement, considering it in light of its possible benefits as well as its potential disadvantages. Though strong rationale might be given to support the use of paraprofessional workers, statements of serious disapproval or doubt are also found throughout the literature; and evaluative studies of programs employing paraprofessionals show mixed results. In fact, many of the programs intended for study dissolved before follow-up investigations could be made. This publication will examine what research findings exist in regard to assessment of program outcomes.

It is interesting to note that noncertified individuals have for centuries fulfilled counseling functions — friends, parents, doctors, lawyers, teachers, ministers, missionaries have served as helping persons for those in need. Tyler (1969) refers to this when she observes that every day parents counsel their children, roommates share concerns and problems, and friends offer understanding and support to one another. The development of formal programs to capitalize on this very natural relationship and thus to expand the human services in school settings, however is of recent enough origin to cause considerable differences in program implementation. A portion of this issue is devoted to descriptions of several programs that have been developed to utilize the services of varying groups of people — teachers, mothers, peer groups, students as workers with younger students, and other lay persons in the community.

Programs using paraprofessionals develop in response to the needs of the community and of the persons for whom they are designed and thus differ in respects other than the type of person performing the service. For example, budget restrictions have considerable impact on the kind of program that will be implemented in a particular setting. Because in many communities money is not always available to hire an adequate number of professionals or support personnel, community members volunteer their time, realizing that the training and actual time spent at work may be equivalent to those of a regular job. Despite the fact that they utilize some of the same practices, these programs involving volunteer aides are sometimes differentiated from paraprofessional programs in that the volunteers are not considered to be performing an occupational role in the literal sense. However, because the tasks are often similar or identical to those performed by paraprofessionals, several volunteer programs have been included in the descriptions.

The Professional Versus the Paraprofessional

In the fields of the human services, certification or licensing is the standard method of determining that one has become a professional. Within the wide variety of roles helping persons may perform, however, differing viewpoints exist regarding such things as how professionals should be defined, what standards should be stressed and maintained, what kind of training should be required, and who should be allowed into the profession. Each state outlines different requirements for certification of teachers, counselors, psychologists, lawyers, physicians. Certification in one state rarely satisfies the requirements in any other state. With such variance in determining criteria for professionalism, then, it is no wonder that those institutions employing paraprofessionals, as well as persons responsible for their training and preparation or who are in the professions themselves, are having difficulty in defining and outlining the role of nonprofessionals.

Some agreement has been reached regarding the characteristics that are common to professionals in general, which Brammer and Shostrom (1968) have identified in the following way:

1. Skills and procedures
2. Definite sequences and standards of training
3. Societies and journals that are dedicated to the advancement of the profession
4. A planned research program
5. Certification and licensing
6. A code of ethics
7. A working relationship with other professions
8. Professional freedom

The authors also note the importance of personal characteristics in the case of counselors or therapists. They believe that although the areas of attitudes and personality are difficult to assess, they merit considerable attention for a person wishing to enter these professions. Professional training for the counselor, according to the authors, should include the development of techniques and skills in communication, test administration and interpretation, sociometrics, and counseling.

Much research has been conducted in an attempt to determine the characteristics that are common to professional counselors. Regardless of the procedure used, results indicate that the differences between the persons of counselors are greater than differences in the techniques used by counselors (Tyler, 1969). Thus, more time is being devoted to the study of what a counselor is rather than of what he or she does, which has led to attempts to determine what personal characteristics are optimal in a counselor. Tyler states that if we dismiss the idea that one standard relationship should exist in every counseling encounter, then we must also give up the requirement that a counselor be any one type of person. Most educators believe that a counselor should be as free as possible of internal conflicts; others feel that a counselor who is experiencing conflicts is better able to understand conflicts in others. Tyler suggests that a good counselor

might have any personality pattern which permits the development of a deep and satisfying relationship with others.

A greater consensus exists about how professional counselors should be trained than about how they should be selected or what services they should provide. This is probably due to the fact that counselor educators must make certain decisions about courses and programs, whereas decisions about selection and use of personnel can be made individually and according to community or school requirements.

As far as personal characteristics, method of selection, and type of service are concerned, there is little to separate the paraprofessional from the ranks of the professional. What are the factors, then, that distinguish the two?

One factor is graduate training, which requires the intellectual capacity to comprehend abstract concepts in areas such as educational philosophy, personality theory, and statistics. In 1964 the Committee on Professional Preparation and Standards of the American Personnel and Guidance Association (APGA, 1964) published guidelines for counselor certification, recommending that the professional counselor have a Master's degree, including two years of graduate work. The graduate program should be designed so that the counselor will emerge with a broad educational background that has exposed him or her to various disciplines and thought; a basic knowledge of psychology, including principles, theories, and research techniques relevant to counseling; a mastery of procedures and skills involved with counseling; and an understanding of the environment in which the counselor will work. The Committee further recommended supervised counseling experiences including laboratory work such as practice in test administration, practicum involving actual counseling, and a full-time internship program in a school or agency.

The counselor who continues his or her professional development in a doctoral program becomes familiar with research-based psychological knowledge and learns how to plan and carry out scientific investigations. Graduate students are chosen for personal qualities as well as intellectual characteristics.

Paraprofessionals are generally selected on the basis of personal attributes, and then through special training acquire the skills and competencies necessary to provide guidance services. They are not expected to demonstrate as profound a knowledge or understanding of philosophy, theory or statistics as the professional; yet it is precisely the lack of that knowledge and understanding that prohibits the paraprofessional from becoming a professional.

Some states and agencies have attempted to provide alternate ways through which people might enter the counseling profession — for example, a number employ teachers as part-time counselors. Many states, although they may specify a Master's degree as a requirement for counselors, do not require a two-year organized program as outlined by the APGA standards. Agencies for the unemployed, the delinquent, or the disabled often employ personnel with less training than described in the APGA statement. By designing and implementing their own training programs, these agencies may even acquire special state certification.

Varying opinions exist with regard to the employment of nonprofessionals in guidance programs. Support has come from professional organizations, such as the American Personnel and Guidance Association (APGA, 1967) and the American Psychological Association (Warnath, 1967), as well as state legislatures and state-level educational agencies. The Federal government has awarded grants for training support personnel (Leland *et al*, 1969; Muto, 1968); and a large number of school districts, community organizations, and professional staff members have responded positively to the use of nonprofessionals in public school services. In addition, several studies (Carkhuff and Truax, 1969; Hadden, 1969; Hallowitz and Riessman, 1967) bear out the fact that persons of similar intelligence and educational level and from like socio-economic class often relate better to one another than do those of widely disparate backgrounds. Carkhuff (1969) also found in a study of helping relations that two-thirds of a group of patients treated by professional therapists improved, but so did two-thirds of a control group of untreated patients. This author goes on to suggest that we look at the help the untreated group probably received from friends, co-workers, families or other concerned individuals. Such findings lend support to the use of the services of paraprofessionals in helping professions.

Many critics and opponents of the paraprofessional pupil services movement, however, may be found. Jesse Gordon (Gordon, 1965) has written about the negative implications of Project CAUSE (Counselor Advisor University Summer Education), expressing some general concerns regarding use of paraprofessionals. This Project, one of the first of its kind, was established in 1964 to train people during an eight-week period to serve as Counselor Aides in the Job Corps or Employment Service youth programs (Odgers, 1964) and created a controversy over the legitimacy of hiring counselors without standard professional training. Along with the furor, however, Project CAUSE and similar programs made people aware that counselors were needed in far greater numbers than graduate programs could be expected to produce (Tyler, 1969). As a result, the concept of utilizing the services of auxilliary pesonnel in the counseling profession began to gain support.

The APGA furthered this movement by issuing a statement legitimizing the functions of counselor aides in both direct and indirect services to clients (APGA, 1967). Direct services include functions such as interviewing and leading group discussions; indirect services include such activities as the gathering and processing of information. The APGA guidelines for the training of support personnel are broad and nonspecific and allow for generous individual interpretation. It is stated, for example, that training should include the opportunity to work under the field supervision of professionals but that the duration of preparation for support personnel will be "fairly brief . . . a matter of weeks or months, compared to years (for the counselor)" (Ibid). Because it formalizes in an official statement the methods by which individuals may gain entry into counseling positions, this recognition of a support personnel group by a professional organization lends a professional status to the paraprofessional counselor. This statement also broadens the avenues through which a person may enter the counseling

profession and thus legitimizes expansion of the supply of needed personnel.

Function of Paraprofessionals in Educational Settings

An important challenge that professionals within the schools face is the division of professional roles into subprofessional classifications or subroles that might be filled by persons who lack professional training. The problem is not too difficult in classroom settings where tasks are rather specific and clearcut, but in the area of pupil personnel services it becomes far more complex because the role of the professional counselor is still in the process of being defined. Whether the paraprofessional is to be used in the classroom or in the area of pupil personnel services, however, the goal is the same: that of providing broader and more effective services to the population served by the school.

The Paraprofessional in the Classroom

Specific functions of the teacher aide have been described extensively in the literature; for a detailed review of specific activities the reader is referred to DeHart (1968). Teacher aide is the term most commonly used to name the role in the classroom; but aides are also described as teacher helpers, lay assistants, nonprofessionals, assistant teachers, auxiliary personnel, and paraprofessionals. Generally speaking, their tasks are assigned at the discretion of the teacher, and recent programs are using the services of paraprofessionals more and more in instructional areas.

The Paraprofessional in Pupil Personnel Services

Specific roles and functions of support personnel in pupil services are frequently not clearly defined due to the relative newness of the concept. Increasingly, however, efforts are being made to clarify ways in which such personnel might be used. One distinction which is often found useful in the development of role statements for paraprofessionals is whether the activities are of direct or indirect service to the clients.

Much disagreement exists as to whether direct services of the paraprofessional, those requiring interface with clients, should be similar to those of the professional. Some persons believe that activities for the paraprofessional should be restricted to indirect services. Others believe that any professional service may be performed by a paraprofessional. Zimpfer (1971) suggests a carefully planned team approach in which subprofessionals assume only certain parts of the helping process while under the direction of the professional.

APGA, in its policy statement, lists 32 suggested activities for support personnel. These are grouped as follows:

1. Direct helping relationships:
   a. Individual interviewing function
   b. Small group interviewing or discussion function
2. Indirect helping relationships:
   a. Information gathering and processing function
   b. Referral function
   c. Placement function
   d. Program planning and management function

According to a survey by Zimpfer (1969) school counselors expressed an eagerness to use support personnel according to the APGA outline. However, because of need, many of the counselors were actually using support personnel only in the clerical and custodial functions of their offices.

Another effort at classifying the duties of the paraprofessional in pupil personnel services is the work of the Committee on Support Personnel for Guidance in the Schools of the Association for Counselor Education and Supervision (Zimpfer, 1971). This Committee surveyed existing programs and the attitudes of support personnel, guidance supervisors in State Departments of Education and school counselors and came up with a series of recommendations for selection, training and use of nonprofessionals.

Fredrickson (In Zimpfer, 1971), working in a local school project funded by Education Professions Development Act, constructed lists of tasks divided according to areas of professional responsibility listed by the American School Counselor Association (1964) and then divided the possible tasks within these categories into three levels of complexity. Listed below are some examples of activities at the three levels:

A. Planning and development of the guidance program
   Level 1: Check supplies of standard forms and fill out routine orders for supplies.
   Level 2: Become familiar with equipment used in electronic data processing.
   Level 3: Supervise and coordinate activities of clerical or other personnel who are under the supervision of a counselor.
B. Counseling Activities
   Level 1: Type reports of case conferences.
   Level 2: Record group interactions or become a discussion leader of a group (with counselor's approval).
C. Pupil Appraisal
   Level 1: Type reports of conferences.

". . . persons of similar intelligence and educational level and from like socio-economic class often relate better to one another than do those of widely disparate backgrounds."

Level 2: Identify students whose test results show discrepancies with school achievement.
Level 3: Interview a student to obtain factual information.

D. Educational and occupational planning
Level 1: Maintain an occupational information file.
Level 2: Secure follow-up information of a routine nature.
Level 3: Help students to obtain information on finanancial aid.

In order to find out what paraprofessionals were doing in college counseling centers, the Task Force on Paraprofessionals in the Counseling Center, established in 1971, polled 135 directors of college counseling centers at the 1971 Annual Conference of University and College Counseling Center Directors at the University of Missouri (Crane and Anderson, 1971). Questions were asked regarding the possible uses of parprofessionals, the types of services performed, and the training, supervision, and payment. Almost all of the centers polled were at public and private four-year universities and colleges. Sixty-three directors responded, giving information concerning their use of paraprofessionals. Of these, 60% reported that they were using undergraduates as paraprofessionals.

The following results were found regarding the services offfered by the paraprofessionals.

	Paraprofessional Service	Number of Centers
1.	**Crisis center or "hot line" telephone service**	11
2.	**Study skills help**	8
3.	**Drop-in center and peer counseling**	7
4.	**General advising and information services**	4
5.	**Clerical work on research**	3
6.	**Companion or befriending programs**	2
7.	**Leading or co-leading groups**	2
8.	**Sex and birth control counseling and information**	2
9.	**Relaxation training and desensitization**	1
10.	**Co-leading communication skills workshops**	1
11.	**Support service for campus minorities**	1
12.	**Occupational information assistance**	1

In a later study Crane and Anderson (1971) polled counseling center directors regarding their attitudes toward the use of paraprofessionals in the centers. They also attempted to determine which activities directors believed should be performed by paraprofessionals under the supervision of a professional counselor. They defined a paraprofessional as a worker who had completed a minimal preparatory training period (6-8 weeks) and had engaged in inservice training with adequate supervision.

Those activities which were likely to receive the approval of the director were:

1. Tutoring disadvantaged students
2. Being a 'big brother' to the dsadvantaged
3. Doing freshman orientation counseling
4. Functioning as a research assistant
5. Counseling students with study problems
6. Administering the Strong Vocational Interest Blank
7. Working on an emergency telephone service
8. Counseling students with problems in adjusting to college

Those activities which were likely to evoke disapproval from the directors were:

1. Counseling students with sexual problems
2. Counseling students with marriage problems
3. Counseling students with symptoms of pathology
4. Administering or interpreting the Wechsler Adult Intelligence Scale or the Rorschach Diagnostic Test

From these studies it may be seen that the division of professional roles into subroles that may be filled by persons who lack professional training is not an easy task, and the level of functioning for support personnel will be dependent not only on the skills of the persons themselves but also on the attitudes of employing institutions.

Summary

Programs involving the use of the services of nonprofessionals are not new to many professions, but their introduction into the field of pupil personnel services has occurred only in the past few years. The recency of the appearance of paraprofessional counselors has created a need for making some judgments about such issues as how they should be selected, what kind of training they should undergo, by what means they should be evaluated, and the kinds of functions they should or can perform. The fact that professional counselors are still in the process of defining their own role has contributed to the difficulty of role definition for paraprofessionals. Several surveys have been undertaken to assess current attitudes and practices concerning support personnel, and a few professional organizations have offered recommendations or guidelines for consideration by employing institutions. The paraprofessional counselor is an emerging phenomenon and is the cause of considerable debate and disagreement in professional circles.

2.
BACKGROUND & DEVELOPMENT

General Background and Development of the Paraprofessional Movement

The use of paraprofessionals in human services can be traced back to the Hull House and Henry Street settlements during the early part of this century. Later, a number of the New Deal programs, such as the Social Security Act of 1935, the Works Progress Administration, and the National Youth Administration (NYA), utilized paraprofessionals. During this post depression period, as part of efforts to stem the rising tide of unemployment and to find new sources of manpower, out-of-school youth and potential school drop-outs were trained and placed in the fields of health, education, recreation, welfare, correction, and the arts. The 1940 report of the NYA showed that 13,000 people were employed in this way. New sources of manpower were also sought through the upgrading of workers. For example, state mental health programs in California and Maryland included special training for psychiatric aides to broaden and enhance their skills.

During the 1950's, when the shortage of teachers and persons in health and social work settings was critical, women with some college education but without formal professional training were pressed into service. Efforts were made to use indigenous workers, or workers from among the groups of people to be served. Examples of this were the New York State Youth Board's "Club Project" and several health-education programs serving Indians, Canadian Eskimos, and migrant workers in Florida. These efforts continued in programs such as Philadelphia's "Great Cities School Improvement Project" and Pittsburgh's "Team Teaching Project," both begun in the early 1960's. Throughout this period, however, the trend was toward recruitment of persons from middle class backgrounds to supplement the work of professionals.

The "New Careers Movement" provided impetus for the paraprofessional idea. The term is derived from the book, *New Careers for the Poor: The Nonprofessional in Human Services*, by Authur Pearl and Frank Riessman (1965). Rperesenting an innovative and socially conscious approach to the use of paraprofessionals, the movement was a response to the following developments:

1. The increasing gap between the expanding need for educational services and the availability of professionals to meet these needs during the 1960's.
2. The need for teachers to function in a more complex role as a result of new dimensions in education concepts and technology.
3. The heightened awareness of communication blocks often existing between middle-class professionals and disadvantaged children.
4. An increased concern for the plight of the poor and undereducated and their need for opportunities for upward mobility.
5. The availability of new resources for school systems through the Office of Economic Opportunity (OEO), the Manpower Development Training Act (MDTA), Title I of the Elementary and Secondary Education Act (ESEA), the Nelson-Scheuer Amendment to the Poverty Act, and the Javits-Kennedy Act for Impacted Areas. All of these provided federal funds for the employment of disadvantaged people lacking traditional certification.

The Economic Opportunity Act of 1964, which included a mandate for the hiring of community people, helped to expand the new careers concept. The Scheuer Amendment to the Act, added in 1966, led to the funding of programs that were characterized by: (1) development of entry level employment opportunities; (2) assurance of maximum prospects for advancement and continued employment; (3) provision of a broad range of supportive services; and (4) inclusion of educational and training assistance. Since then, more than 30 laws have established some 100 grant-in-aid programs which either in-

corporate or permit the new careers design. Programs funded by the Scheuer Amendment have involved over 17,000 trainees; and nearly 400,000 people have been employed by schools and by community action, health and welfare, law enforcement, recreation, and community development agencies.

Thus, the new careers efforts were not undertaken solely as a response to manpower shortages. The indigenous paraprofessional idea resulted from an attempt to provide a new pattern of instruction directed toward new educational goals. The indigenous workers were seen as persons who could exert considerable influence in the community through working in local institutions and programs. They were viewed as potential change agents who could help schools or other organizations or agencies become more representative of and responsive to the needs of their populations. The thrust of the movement was not simply to patch up institutions by filling manpower shortages but rather to change institutions and programs in a way that would be positive and meaningful for the people for whom they were created.

Use of indigenous paraprofessionals increased in 1963 as a result of funding of major programs under the President's Committee on Juvenile Delinquency and Youth Crime. One of these, the Mobilization for Youth (MFY), located in New York City's lower East Side, used older delinquents to work with younger delinquents, in addition to using indigenous workers in schools and community work. As a result of the MFY, Frank Riessman (1965) made the first published call for what he termed "the new nonprofessional." At this same time the center for Youth and Community Studies at Howard University began to train young people from disadvantaged backgrounds as paraprofessionals in such fields as child and health care, community organization, recreation, and research.

In 1964 a large number of projects began to respond to the concept of utilizing indigenous nonprofessionals. The New York State Division of Youth's "Youth Worker Training Project" employed school drop-outs and rehabilitated offenders; the "New Careers Development Project" trained inmates in a California prison as program developers; and Project CAUSE, a summer program of the Department of Labor, trained nonprofessionals to staff Youth Opportunity Centers as counselor aides and youth advisors. In 1964 the Office of Economic Opportunity was established and soon became the largest employer of paraprofessionals. By 1965 approximately 25,000 paraprofessionals were functioning in community action programs and over 46,000 in Head Start programs. During the latter part of the 1960's a number of studies by the National Education Association revealed a widespread trend on the part of individual school districts to employ aides in educational settings.

At the beginning of this decade various national study commissions and Presidential advisory bodies identified areas in which nonprofessionals might perform needed public work. One such study (Sheppard, 1969) involved in a survey of 130 cities as to the number and kind of work positions that could be filled by nonprofessionals in order to meet existing needs. The results of this study are listed below and may be considered to be limited in that they involve only municipal jobs as identified by chief executive officers of the 130 cities.

Nonprofessional Public Service Job Possibilities

Category	Number
Antipollution enforcement	900
Education	39,134
Fire	5,390
General Administration	5,313
Health and hospital	18,790
Housing codes and inspection	1,473
Library	3,159
Police	11,161
Recreation and parks	14,359
Sanitation	7,[illegible]4
Urban renewal	7,600
Welfare	18,497
Total	140,689

From the above table, it may be observed that the need for paraprofessional workers is extensive and covers a wide range of possible work settings.

Paraprofessionals in Mental Health Fields

Many factors developing over the past few years have heightened the awareness of concerned individuals that the mental health needs of this country cannot be met through existing professional manpower and methods of treatment. The breakdown of the nuclear family, the increase in the number of elderly people, the burgeoning population, the growing hordes of the poor have all contributed to a need for more mental health facilities and workers in the field. The unmet needs have become more apparent as a result of civil rights efforts and the war on poverty. In addition, feelings of alienation and impersonalization resulting from ubanization and technology have led to increased stress on human beings. Rising costs of medical care and the widening gap between the rich and the poor are making imperative the need for mental health facilities that are available to all, regardless of abililty to pay for services. The need for more resources has been dealt with in part by the establishment of a nationwide network of community health centers, but staffing them remains an urgent problem.

Although volunteers have actually been used for many years in the mental health area, in the past such work has been characterized by a demeaning quality that has contributed to an uncommitted attitude on the part of the workers. A typical example is the psychiatric aide who works in a hospital setting doing supportive work with little or no training and little status. Recent efforts have been directed toward providing a new approach to the utilization of the paraprofessional or volunteer, including careful attention to selection, training and supervision. As a result, the last few years have seen a substantial growth in training programs, ranging from brief on the job experiences to two-year programs in community colleges.

Numerous changes in approaches and attitudes in mental health have led to and encouraged the development of new roles for nonprofessionals. A significant change has been the questioning and subsequent alteration of traditional methods of psychotherapy. Psychologists and other mental health workers are rejecting the traditional Freudian psychoanalytic approach

which for so many years has dominated psychological theory and practice—that is, the necessity for a person to have an in-depth intellectual and emotional understanding of the historical antecedents of his or her problems. The breakdown of this traditional concept of psychotheapy has allowed for an expansion of the role of the psychotherapeutic agent and the creation of new and less highly skilled roles. It has permitted new segments of the population to participate in mental health treatment activities.

These changes in attitude are reflected in the kinds of services now performed by nonprofessionals. The "therapeutic community" features group and individual counseling, training in self-management for patients, and retraining in activities such as shopping, personal hygiene and communication with others. The nonprofessionals (psychiatric aides, ward attendants, recreational aides, and community volunteers) participate freely and are given extended contact with patients. Thus, for the nonprofessional, a change has occurred from performing purely custodial functions to involvement with rehabilitative functions. The paraprofessional has increasingly become an integral part of the mental health team.

Realization that long-term confinement may lead to increased difficulty with readjustment to community life has resulted in a trend toward shortening the period of hospitalization. Communities, in turn, have responded by creating more facilities within the community, including outpatient clinics and services and liaison persons who are often paraprofessionals.

A new method of treatment which focuses on "social competencies" provides rehabilitative service for those whose functioning has been impaired. This approach, which involves the development of skills needed for more efficient self-management, represents a significant change from traditional therapeutic goals. The people needed for implementing such an approach are those who can teach coping techniques through direct education, supportive help, and the provision of ego models. The self-help or social competency model has implications for paraprofessionals—in fact, these changing concepts of mental health and its treatment provide extensive rationale for the use of paraprofessionals in the field.

Another important change has occurred in the concept that traditional graduate education is the most effective means for training mental health workers. There is little evidence to suggest that graduate school training produces attributes which lead to success in helping people (Cowen, 1967). It is quite possible that natural empathy, understanding or other personal qualities of nonprofessionals might equal or excel those which the professional obtained through training. In a study by Poser (1966) the effectiveness of entirely naive college undergraduates as group therapists with chronic, hospitalized schizophrenics was compared with that of experienced professionals, primarily psychiatrists and social workers. The college students were untrained, had few psyphology courses, and had no experience in the mental health field. The professionals were highly trained and qualified with many years of professional experience. Both groups of therapists were encouraged to promote interaction in their groups and received few restrictions. The effects of therapy, evaluated by a comprehensive battery of tests, showed that all treated subjects improved more than untreated ones. However, within the treated group, those patients seen by lay therapists registered greater gains than those seen by professionals. These changes proved to be stable over a three-year period. It was hypothesized that the critical factor may have been the interest, enthusiasm, and energy of the students. The Poser investigation encourages professionals to re-examine the importance of professional training and experience and reassess the potential for nonprofessionals in mental health treatment. This study by Poser, in addition to numerous other studies, provides evidence that people without professional training are able to provide meaningful, effective, and useful mental health services.

Manpower shortages, the reevaluation of jobs and qualifications for those jobs, and the recognition of the useful potential of nonprofessionals have contributed to an increased interest in employing paraprofessionals in mental health fields. In addition to these factors, the impact of budgetary realignments in Federal programs resulting in reduced funding for professional-level training, plus an increased emphasis on training programs for paraprofessionals, have added to the upsurge of paraprofessionals in the mental health field.

Specific examples of the benefits to be gained from using nonprofessionals rather than professionals in mental health fields have been described in recent literature (Stevenson and Viney, 1973). Studies have shown that the nonprofessional is better able to identify with patient life-styles and concerns, and is therefore able to provide patients with a more appropriate model for behavior. Often the paraprofessional is able to play a more active part in the life of the patient than the professional. In addition, paraprofessionals commonly bring fresh points of view to therapy programs and may be successful due to the enthusiasm and energy they bring to the therapeutic process.

The recent investigations of Rioch (Rioch, et al., 1963), Carkhuff (1968) and Carkhuff and Truax (1965) provide evidence of the effectiveness of paraprofessionals as treatment agents. The Adult Psychiatry Branch of the National Institute of Mental Health funded a Mental Health Counselors program in 1960 (Rioch, et al., 1963). The program was designed to provide low-cost psychological treatment for patients and at the same time to provide work for women with grown children who wished to contribute their services in a meaningful way. Eight women were chosen for the program, based on their successful child-rearing experiences and maturity. All had college educations and came from upper-middle-class status. They all participated in a two-year training program without pay or guarantee of a job at completion of training. The training was limited to psychotherapeutic techniques and emphasized on the job training. An evaluation of the therapy sessions of the trainees with adolescents at the conclusion of the program revealed positive results for the patients. Other programs, such as the Child Development Counselor's program at the Washington, D.C., Children's Hospital and the Albert Einstein College of Medicine, Mental Health Rehabilitation Worker's Project, successfully trained and used middle-aged women as helping persons.

The development of positions for nonprofessional staff personnel is a practical and substantive response to new concepts of treatment. The paraprofessional might be

"As a result of a number of factors—including the orientation of the professional staff to the program, the role assigned to the paraprofessional, the facility with which the aide performs that role, and the attitudes of existing professional staff toward the newcomer—the paraprofessional may be viewed as a strong asset or a threat to the credentialed professional."

viewed as unique in that the individual performs adjunctive tasks but may also be involved in new activities such as "reaching out" to isolated people, helping people in at-home settings, or providing primary social support.

The following typology of service functions for nonprofessionals in mental health (National Clearinghouse for Mental Health Information, 1969) provides a classification based on current practices:

1. The Caretaker Function: Providing physical care and supervision.
2. The Bridging Function: Acting as a connection between the person in need and sources of help.
3. The Sustenance or Social Support Function: Providing substitute personal relationships.
4. The Professional Assistant Function: Functioning as an aide or assistant in a closely adjunctive manner to and under the supervision of the professional.

Paraprofessionals in The Classroom

During the 1950's aides were introduced into school systems as a solution to teacher shortages. Expansion of the use of nonprofessionals in the schools during the 1960's occurred as a result of the post-World War II baby boom and the passing of a series of anti-poverty programs. Following the funding of the Economic Opportunity Act of 1964 and the Elementary and Secondary Education Act of 1965, aides were to be found in increasing numbers in public schools. Programs such as New York City's "Mobilization for Youth" (MFY), funded under the President's Committee on Juvenile Delinquency, exemplified the new emphasis on the use of nonprofessionals.

The first major experiment in the use of nonprofessionals in American education occurred in 1953 in Bay City, Michigan (Gartner, 1971). Many people look on this project as a milestone in the paraprofessional movement. Yet some believe that the resistance created among teachers by the program impaired progress in the use of nonprofessionals in schools for at least a decade.

The project was funded by the Ford Foundation through a grant issued to Central Michigan State College of Education and was a joint project of the College and the Bay City school system. Increased enrollments in the schools had contributed to mounting pressures on teachers. The purpose of the program therefore, was to increase their effectiveness by freeing them from jobs that might be performed by nonprofessionals. A study had shown that 69% of a teacher's time was spent in nonteaching chores.

The project employed eight college-trained women as teacher-aides. The Bay City school district and the Central Michigan State College of Education developed a program to train these teacher-aides that was soon adopted by over 50 other Michigan systems.

An evaluative study by the College revealed the following results:

1. Members of the teaching profession reacted negatively to the employment of aides because they believed that funds should be used instead to employ additional professionally qualified teachers.
2. Teachers with aides spent more time on instructional activities.
3. Little objective evidence was found regarding differences in the quality of instruction between classrooms with teacher-aides and classrooms without aides.
4. The teacher-aides facilitated experimentation, though no noticeable evidence as to changes in teaching methods was found.
5. Little effect on overall costs was observed.
6. Many of the aides became potential recruits for teaching.

Subsequent to the Bay City project, other communities across the nation quickly followed suit, and by 1961 over 5,000 aides were employed in various educational settings.

A study conducted for the Office of Economic Opportunity by the Bank Street College of Education in 1966 (Bowman and Klopf, 1968) was based on a nationwide survey of the use of teacher-aides, teacher assistants, family workers, and other auxiliary personnel in the classroom. An important component of this study on the use of paraprofessionals in school settings was the coordination and analysis of fifteen demonstration training programs for auxiliary school personnel. An examination of the purpose of these training programs provides further enlightenment on the use of paraprofessionals in education. The sponsors of the projects believed that the introduction of more adults into the classroom would enhance the quality of education, increase the opportunity for individualized instruction and make possible less structure in the classroom.

The adults for the projects were selected on the basis of their concern for children and their potential as supportive personnel, rather than on the basis of previous education. The trainees were from diverse cultural backgrounds—Navijo Indians from a reservation, low income whites from Appalachia, Blacks from a number of

large cities. Puerto Ricans, and a variety of other groups. The belief supporting this kind of personnel selection was that individuals who had actually lived in disadvantaged areas might provide specific benefits for disadvantaged children. Such persons, having experienced alienation in the classroom might help these youngsters feel more comfortable in school settings, and might serve as models to motivate the children. It was believed that these paraprofessionals could serve as interpreters of children's behavior to other professionals, and that they might also interpret the ideas and goals of the school to the children and to their parents.

The study also notes several economic forces which contributed to the sharp increase in the employment of auxiliary personnel in the schools during the late 1960's, such as the following:

1. Changing and expanding needs for school services.
2. A shortage of professionals to meet these needs.
3. New dimensions in education which required a more complex and demanding role for teachers.
4. New awareness of the special needs of disadvantaged youngsters.
5. An awareness of the communication block which often exists between middle-class professionals and lower-class pupils.
6. The necessity of education for competition in an increasingly automated economy.
7. The availability of Federal funds for the employment of nonprofessionals.

The late 1960's have also seen:

1. The passage of the Education Professional Development Act.
2. The utilization of over 200,000 pupil personnel workers in school settings.
3. Issuance of policies by several state Departments of Education and state Boards of Education pertaining to the use of paraprofessionals—for example, the California Instructional Aide Act of 1968 (State of California).
4. The involvement of professional education organizations (National Education Association, American Federation of Teachers) in researching and defining the role of the paraprofessional and becoming involved in organizational efforts of paraprofessionals. The research division of the NEA reported that teachers identified how to work effectively with aides as their number one training need. The American Association of School Administrators in a resolution concerning the use of nonprofessionals encouraged " . . . the employment of auxiliary personnel to free teachers from nonteaching duties." (AASA, 1967) The National Association of Secondary School Principals recommended the use of instructional assistants and general aides who were defined as selected workers paid to do specific tasks (Fisher, 1968).
5. A proliferation of materials, guides and resources to assist in the implementation of programs.

Attempts to involve the community persons more directly with the schools are increasing throughout the country. It is common to find ghetto parents demanding participation in school policy-making and planning to foster certain kinds of education for their children. The "Bundy Plan" in New York City is an example of an attempt to respond to this demand by using paraprofessionals to make the goals of the school more attunded to those of the community (Schmais, 1967).

Studies in Indiana, Minnesota, Michigan, Colorado and New York have examined the effects upon pupil learning of the use of paraprofessionals in the classrooms:

1. Studies in Minneapolis, Minnesota, as measured by pre-tests and post-tests using the Metropolitan Reading Readiness Test with 234 children, indicate that students in kindergarten classes with an aide made significantly greater gains in reading readiness, number readiness and total readiness than did matched pupils in classes without an aide (Minneapolis Public Schools, 1967).
2. In Greenburg, New York, performance of second graders in classes with aides was contrasted with that of classes scoring above grade level increased from two to five. The outcomes were attributed to the use of teacher aides (NEA, 1969).
3. A Detroit, Michigan, study of 4,905 paraprofessionals employed in Wayne County schools revealed that administrators and teachers believed the teacher aides were effective in proving the education of the children (Garnter and Schroeder, 1968).
4. In a Title III ESEA Program in Greeley, Colorado, pupil gains were attributed to the use of paraprofessionals (Cheuvront, 1968).
5. A tutoring project originated at Indiana University found positive effects on student performance in 50 projects throughout twelve states. The tutoring program involved in a 21-hour training program for paraprofessionals to prepare them for tutoring first grade children for fifteen minutes a day (NEA, 1969).
6. In a student tutoring program in New York City in which older students tutored younger ones, those who were tutored gained 6.0 months as compared with a gain of 3.5 months for the control group (NEA, 1969).

The use of students as teacher aides is frequently identified as a cause of educational gains. The opportunities for cross-age learning include cross-age teaching, student-teacher learning teams, and the divisions of classes into sections. Improved learning results for the tutor as well as the tutored. The Educational Professions Development Act encourages these efforts, as do guidelines in numerous state Departments of Education.

There are strong indications from measurements in reading readiness and achievement that teacher aides trained in tutoring improve pupil performance (Riessman and Gartner, 1969). One program sponsored by the Mobilization for Youth (STAR-Supplementary Teaching Assistance in Reading) uses paraprofessionals to train parents to read to children; and this program, as well as others using aides or tutors, indicates significant pupil gains.

Evidence is also growing to the effect that the use of paraprofessionals allows teachers to improve their teaching. They have more time to give individualized instruction to children, to prepare lessons, and to improve the learning climate in the classroom (Ferver and Cook, 1968).

Paraprofessionals in Pupil Personnel Services

The need for paraprofessional guidance workers became apparent as a result of the following developments:

1. **Manpower shortages.** In 1967 the Interagency Task

Force on Counseling (United States Department of Labor, 1967) reported that over 95,000 new counselor positions would be needed by 1971. About 60,000 people were estimated to be earning degrees and certificates in guidance and counseling during that time, leaving a deficit of 35,000 professional counselors.

2. **Expanded role expectations.** The expanded role expectations for counselors revealed a need for paraprofessional workers. The new expanded role developed as a result of the following:

a. The awareness of the necessity for counselors to respond to the needs of increasingly diverse segments of society.

b. The demand for research and the need for data collection for that research.

c. The calling for counselors to translate into action increasing amounts of research results.

d. The availability of numerous new counseling techniques.

3. **Awareness of new factors.**

a. The realization that professional counselors may be less effective than paraprofessionals with certain populations.

b. Awareness that professional training is not necessarily the only prerequisite for becoming an effective counselor.

cept in the following ways:

1. The concept of support personnel does not refer to consultative or referral relationships between the counselor and social workers, psychologists, or other helping professionals.

2. Support personnel function in a line relationship to counselors.

3. Career patterns differentiate counselors from support personnel. Support personnel jobs may or may not provide specific promotional possibilities. If support personnel wish to become professional counselors, they must meet the necessary academic and personal qualifications of professional counselors.

4. Counselors perform the counseling function, whereas support personnel perform activities that contribute in other ways to the overall service.

5. Counselor activity involves synthesis and integration of parts of the total range of services, whereas the work of support personnel tends toward the particular. These persons may also specialize in one or more support functions.

6. Counselors base their performances on relevant theory and knowledge of effective procedures. Functions of support personnel are characterized by more limited theoretical background.

The statement distinguishes support personnel from clerical and secretarial personnel in two ways:

1. Job training: includes exposure to principles and practices of guidance through preservice, inservice, or on the job training.

2. Job tasks: more related to guidance functions than to clerical functions.

". . . if we dismiss the ideal that one standard relationship should exist in every counseling encounter, then we must also give up the requirement that a counselor be any one type of person."

American Personnel and Guidance Association Role Statement for Support Personnel

In 1967 the American Personnel and Guidance Association adopted a policy statement on the role and preparation of aides in counseling. The statement gives a rationale for the use of support personnel in guidance and states guiding principles for role development, preparation and activities. The policy statement reads as follows:

> . . . appropriately prepared support personnel, under the supervision of the counselor, can contribute to meet counselees' needs by enhancing the work of the counselor. The appropriate work of such personnel will facilitate the work of the counselor and make the total endeavor more effective. (APGA, 1967).

The APGA role statement suggests certain direct and indirect role functions for nonprofessionals. However, it does stress that the one-to-one or "direct" contact of a nonprofessional with a client is not the equivalent of the direct one-to-one professional counselor-client relationship.

Although not specifically defining the term "support personnel," the APGA statement does describe the con-

Report of the Interagency Task Force on Counseling, 1967

The Report of the Interagency Task Force on Counseling of 1967 (U.S. Department of Labor) was concerned with the problem of providing counseling and related services to those in need of such help. The task force was comprised of leaders in counselor education and professional guidance practitioners from a variety of settings. The views of the committee are reflected in the following statement:

> The primary work objectives of the counselor are to help the individuals he (or she) serves understand themselves and their opportunities better in order that they can formulate plans, decisions, and concepts of self which hold potential for more satisfying and productive lives, and to help them implement their decisions and plans. As a secondary and related objective, the counselor seeks to effect changes in the environment which are conducive to

increasing individual opportunity for self-development. (Ibid. p. 28)

This statement, which sets the tone for the report, shows a definite potential for the use of support personnel, and the report makes frequent reference to the use of support personnel in counseling.

The main recommendation of the Interagency Task Force involved the need for rapid increases in the number of guidance counselors. In addition, the report revealed a concern for the strengthening of professionalism in counseling. It did note, however, that persons other than counselors might perform counseling functions. The Task Force recognized the use of nonprofessionals as support personnel and stated that such an approach should be "systematically and judiciously developed in federally supported counseling and guidance programs." (Ibid. p. 45) Stated as the basic reasons for the use of support personnel were the facilitation of services and the increase of the effectiveness and productivity of professional counselors.

The Task Force pointed out that the utilization of support personnel would create the need for new training and supervisory responsibilities for counselors. Although the employment of support personnel might result in a short term reduction in the demand for professional counselors, according to the report the long range result could not be foreseen as one of reducing the need or demand for professional personnel.

The report states that support personnel should work only in situations where they are under the direction and supervision of professional counselors. Professional counselors would be distinguished from support personnel by their levels of preparation and their "extensive knowledge . . . of program objectives and operations, extensive use of technical knowledge and skills . . . and considerable use of judgment." The Task Force stated that support personnel should be utilized in ". . . prescribed and limited procedures not requiring analytic judgement or interpretation." (Ibid. p. 47)

In a "policy of relevant professional organizations" the Task Force dealt further with the problem of support personnel. In this policy, the Task Force referred to the APGA role statement concerning support personnel, reproducing the report in its entirety and drawing attention to the concept statements made by APGA as to the differentiation of role and function between professional counselors and support personnel.

The Task Force foresaw potential competition, confusion, and conflict arising from the use of support personnel. As a result, it made the following recommendations:

> . . . that legislation be proposed to establish a series of pilot, experimental, and demonstration projects to plan the preparation of, prepare, and appropriately use the services of counselor support personnel. (Ibid. p. 52)

It further recommended that an advisory panel of experts or consultants be appointed to review the subject and make recommendations. The Task Force was unwilling to go beyond making recommendations regarding the use of support personnel in counseling. Its members stressed the fact that decisions concerning such support personnel should remain under the control of the profession. In general the Task Force exhibited a cautionary view toward support personnel.

Neither of the two agencies more directly involved —the Department of Labor and the Department of Health, Education and Welfare—took action to draft the legislation which was recommended by the Interagency Task Force, despite the concensus of the Task Force that the recommended steps were urgently required to expand counselor manpower. Thus growing divergence occurred between government administrators and professional guidance leaders in their basic stance toward guidance and counseling.

In 1968, California became the first state to adopt specific legislation in behalf of support personnel in schools. The State's Instructional Aide Act of 1968 permitted the use of aides both for teachers and for other certified school personnel. New York State also adopted legislation which supported teacher aides (State of New York, 1969).

The 1970's are a time during which much thought and effort have been directed toward the humanization of helping services. Increases in technology have resulted in an awareness of the neglect of personal concerns and a general feeling of dehumanization in our society. Human services are seen as a way to cope with this problem. In 1970 the National Association of Pupil Personnel Administrators stated in a policy position paper, "Paraprofessionals, including aides, who are employees of the district, and volunteers can greatly increase the effectiveness of the human services." (Bobbitt, 1969)

Summary

Developed as a response to a combination of forces and pressures, the paraprofessional movement started early in this century in social work settings, gained momentum in post-depression years by expansion into other professional fields, spread into educational settings in the 1950's, and became widespread during the 60's and 70's. The paraprofessional counselor is the most recent addition to the movement and came into being as a result of manpower shortages, expanded role expectations for counselors, and a new awareness that the unique needs of large segments of the school's population were not being met through existing services.

The American Personnel and Guidance Association lent a certain "professionalism" to the concept by issuing a role statement for support personnel, stating that such persons have the potential for enhancing the work of the counselor. Since then a number of states have "legitimized" the utilization of nonprofessionals in schools by adopting specific legislation on their behalf.

3.

GUIDELINES FOR USING PARAPROFESSIONALS

Various authors offer different guidelines for the use of paraprofessionals. The suggestions of Schmais (1967), which represent a reasonable consensus among those who have written on the subject, are presented here as useful for persons interested in developing programs using paraprofessionals:

1. Goals and objectives should be agreed upon, clear, and understood by all involved.

2. Adequate funding, staff time, training, and advancement opportunities should be provided.

3. The role and functions of the professional should be well-defined and described.

4. Recruitment of appropriate personnel should involve as many staff members as possible. Interviews with prospective employees might be conducted with all staff members present.

5. Screening and selection of nonprofessionals should be based on criteria that evolve from the goals of the program.

6. Training of paraprofessionals should include orien-

tation, on the job training, and inservice education.

7. The paraprofessional program should include supervision. This might be provided by one individual for all nonprofessionals in a school, or it might be on a one-to-one basis between a professional and paraprofessional.

8. Evaluation should be continuous and ongoing, of both the program and the performance and progress of the paraprofessional. Evaluation should be derived from the program—its goals, its workability, and its effects upon students, professionals, and the nonprofessionals themselves.

Selection

The selection of paraprofessional workers in education and the human services should be based on a set of criteria which are in line with goals of the program. The procedures for selection may vary from one program to the next, yet general agreement exists as to the advisability of including as many staff members as possible in the process.

Riessman (in Guerney, 1969) suggests procedures for the selection of paraprofessional workers in New Careers programs. Riessman believes that the group method of interviewing can be used quite successfully in the selection of personnel. Not only is the group process economical in time, but more important, it permits the interviewers to observe how the candidates relate to other members of the group.

Riessman further states that the competitive nature in a group selection procedure may be somewhat reduced if certain measures are taken. The setting should be informal, possibly with refreshments available. The leader of the group, who is appointed before the session, should set a leisurely pace, allowing for ample warm-up time. The group size should be limited to ten people, and the seats should be placed fairly close together. The selectors should encourage all of the people to participate, but spontaneous interaction should be encouraged and is preferable to calling formally upon persons to contribute.

Other selection procedures might range from individual interviews to the completion of training courses at a certain level and proficiency. Zimpfer (1971) offers recommendations for the recruitment and selection of support personnel in guidance. He feels that the recruitment and selection policies should be determined by the following factors:

1. Both the nature of the support personnel program and the types of people to be recruited should be determined by local needs and priorities.
2. A job description and the criteria for the individual who is to perform the job should be available.
3. The selection criteria should include personality factors.
4. The pool of applicants should be as large as possible.
5. Publicity of the job opening should be widespread.
6. The counselor should be a part of the employment interviewing and selection process. A trial employment period might be useful in determining the best combination of support personnel and counselor.
7. Schools should consider people who might offer more than simple performance of routine functions, such as individuals who are culturally different or who possess special skills.

A variety of other selection procedures is possible. Each program should base its methods for selection on its own program needs. Examples of procedures for selection that have been implemented may be found in the section on paraprofessional program descriptions.

Training

Training programs for nonprofessional workers should include the following:

1. Orientation
2. On the job skill training
3. Inservice education
4. Supervision
5. Followup

The American Personnel and Guidance Association role statement for support personnel (APGA, 1967) presents a model training program designed to implement the role conceptualization. A description of the preparation of such support personnel may be found in the APGA role statement in the Appendix.

Zimpfer (1971) states how the differentiation of tasks and levels for support personnel in guidance allows for the development of pre- and inservice training programs with specific goals and objectives. According to Zimpfer, the training of support personnel for school guidance programs is in its embryonic stage. Early efforts to formalize both the selection and training of support personnel have varied greatly, but all of the programs examined by the author combined classroom instruction with on-the-job training. Some of the programs, however, either encouraged or required the completion of graduate-level courses in counselor education, while others did not call for any professional course work.

Riessman (in Guerney, 1969) designed training programs for New Careers projects according to his beliefs that the traditional long training periods for paraprofessionals are unnecessary. The author believes that a training program should be combined with work, or "jobs first —training built-in." Accordingly, if most of the training is to take place during performance of the job itself, it is necessary that job functions be phased in slowly, giving the nonprofessional time to master each task before proceeding to the next one. This is referred to by Riessman as "phased training." Riessman suggests that any pre-job training be short and oriented toward enabling the paraprofessional to perform adequately the simple entry functions of the job. Phasing should be accomplished in such a way that in the beginning the nonprofessional will be expected only to perform limited tasks. The remaining skills should be learned through on the job training and systematic inservice training. According to this plan, the paraprofessional would be placed on the job as quickly as possible, working perhaps for part of a day and under close supervision.

Riessman believes that the significant training occurs on the job. In this way the aides learn from their own experiences, from one another, and from their supervisors. In addition he recommends that meetings be held to teach certain skills or to discuss general or specific problems.

The author points out the desirability of having one person responsible for selecting, training, and supervising the aide. This allows the aide to identify with one

"Many factors developing over the past few years have heightened the awareness of concerned individuals that the mental health needs of this country cannot be met through existing professional manpower and methods of treatment."

person and prevents the confusion which might arise from multiple leadership. Also, one or more consultants should be available for the trainers. Where factors do not allow for this one-to-one training relationship, a system of terms might be set up.

The professionals in a school or agency may volunteer to select, train, and supervise nonprofessional personnel. Some general suggestions might be offered regarding how the professionals might use the nonprofessionals, yet Riessman believes that it is usually best to allow the professionals to define the assignments and the working relationship.

Riessman makes the following basic recommendations for the training of nonprofessionals, especially in New Careers programs:

1. Trainers should anticipate competitive feelings toward professionals. They should not expect the nonprofessionals to identify with the poor.
2. The nonprofessionals should receive constant support and assistance from the supervisors who should be present or available at all times. Opportunity should be provided for the nonprofessional to exercise initiative and creative response, and the nonprofessional should be consulted about matters relating to the program, rules for its operation, and the like.
3. Efforts should be made to reduce competitive feelings among the paraprofessionals.
4. Continuous training should be provided to improve abilities in report writing, filling out forms, making outlines, reading effectively, and other skills required by workers.
5. The training staff must clarify promotion procedures, indicating what is needed for advancement on the career ladder.
6. The nonprofessionals should be encouraged to form their own groups or unions. Such groups are important in enhancing feelings of status for the aides and contributing to positive identification with role and job.
7. The value of one-to-one relationships in training should be stressed. If it is not possible to assign all aides to professional workers, other persons might be used. Riessman found that experienced, trained nonprofessionals can be effective on a one-to-one basis in helping new nonprofessionals adjust to the requirements of the job.
8. Efforts should be made to lessen the anxiety levels of non-professionals which result from job ambiguity. These efforts might include the following:
   a. Slow phasing of tasks
   b. Careful definition of the job
   c. Development of group support
   d. Provision of specific training and evaluation with an emphasis on positive performance
   e. Provision of continuous supervisory support and assistance
   f. Frank discussions of program and role difficulties.

Several institutions of higher education offer programs in which support personnel might enroll (Nerenberg, et al. 1969). One example that was reported by these authors was designed specifically for support personnel in guidance and is operated through a university. Another program trains aides in a variety of settings, using community college facilities and course offerings as part of its program.

Zimpfer (1971) has prepared an outline of activities which should be part of a training program for support personnel in guidance. The activities are divided according to the following major categories:

1. Human relations skills
2. Clerical and audiovisiual skills
3. Guidance center skills

These areas are discussed by the author in detail and are simplified into the following chart:

Activities Within Parts Of a Support Personnel Training Program*

Human Relations Skills

A. Listening	1. Intra-personal dimension
B. Observing	2. Inter-personal dimension
C. Articulating	3. Person to person via technology

Clerical-Audiovisual Skills

1. Typing	5. Telephone Procedures
2. Duplication	6. Filing
3. Letter writing	7. Audiovisual Equipment Operation

Guidance Center Skills (a sample)

1. Collection and display of occupational information	6. Follow-up procedures
2. Dissemination	7. Structured interviews with parents
3. Test terminology	8. Class scheduling
4. Recording students data	9. Coordination of visits of
5. Job application procedures college representatives

An Overview of "What's a Counselor?: A Pupil's Counseling Primer"

by Anna G. Dodson

"What's A Counselor?: A Pupil's Counseling Primer," a 28-page booklet, was designed in response to a need for a tool to help young children become more aware of the role of the counselor. The Primer, which has a controlled reading level, consists of effective illustrations depicting the philosophy and developmental concepts of an elementary school guidance program.

In the booklet, a young child asks, "What's a counselor?" An older pupil replies by telling how the counselor works with teachers, parents, and the principal to help children. She stresses the fact that counselors like to work with *all* boys and girls, especially those who are sad, mad, lonely, and afraid. After giving a complete description of the work of a counselor, she closes by saying, "That's a counselor."

The Primer is used by counselors in the classroom with class-size groups and in small group sessions. It is also used as a coloring book, for role playing activities, and has been made into color slides and posters. When used as a test or slide presentation, the counselor or a pupil reads the captions. This is followed by a discussion and role playing. The classroom teacher extends the session by combining language arts and art lessons, and having the children write a brief paragraph about the work of the counselor and color a booklet. (A booklet is taken apart and each pupil colors one page.) Illustrations, which are enlarged by use of an overhead projector, are made into color posters and used for bulletin board displays.

Norfolk counselors report that the Primer: (1) stimulates lively follow-up inquiry into the role and meaning of the counselor; (2) invites pupils to discuss related experiences relevant to those of characters in the illustrations; and (3) is easy to read by children of all ability levels. It is suggested that the Primer be used at the beginning of the school year, when the counselor visits the classrooms to discuss his role, and again at mid-year to re-emphasize his services. It is further suggested that it be used continuously with small groups of pupils who enroll throughout the school year.

use of support personnel should include opportunities for the support personnel to express their own feelings and ideas about the program. The professionals who are training the nonprofessionals might arrange meetings with a consultant who is responsible for the nonprofessionals. These meetings could provide an opportunity for discussing experiences, voicing concerns and obtaining advice or suggestions.

Examples of Training Programs

Example 1. Oregon State University (1969) sponsored an institute for the preparation and training of support personnel to assist counselors in disadvantaged elementary and secondary schools. The institute, funded by an EPDA grant, provided for the training of ten guidance aides during the summer of 1969. The program consisted of six weeks of preservice training, including both seminar and laboratory experiences, followed by a year of inservice training.

One of the requirements of the program was that a team of three people from each school that was to be included in the program participate in the training together. The teams consisted of the counselor, the school principal, and the prospective counselor aide. Previous preparation was provided for the counselor in the role of supervisor; and the principal was asked to reevaluate his or her own role concepts, in addition to conceptions held concerning the roles of the counselor and the counselor aide. The first phase included tryout activities in which the team worked together on projects planning a support personnel program for their school.

Selection of the schools for participation was based on the intent and willingness of the district to take part in the program. Aides were required to have a high school diploma. In addition, personal criteria for selection of aides included high moral character, the ability to relate well to and communicate with the population of students in the school in which the aide would be working, evidence of dependability based on past work experience, responsibility, initiative, and cooperativeness. The expectation was, too, that these aides might later become professionals in counseling.

Example 2. This training project included 99 persons who had been selected for an ESEA Title III program for training the "school associate" during the year 1967-68 (Educational and Cultural Center Serving Onondaga and Oswego Counties). The enrollment was limited to people who were high school graduates, showed a commitment toward a career line program, were already employed in some supportive capacity in the Onondaga and Oswego County school districts in New York State, were working with a professional "sponsor teacher," and had attained a certain level of performance on standardized tests.

All of the participants were women, and their training involved core training, in-service workshops, and optional college credits. The core training consisted of:

1. Orientation - one session
2. Audio-visual procedures - eight sessions
3. Child-development - six sessions
4. Tests and measurements - six sessions
5. An orientation to the second year of the project.

Four workshops held over the period of a year served as forums for the expression and exchange of ideas among administrators, teachers, and support personnel. In addition, college-level courses were arranged at the Onondaga Community College. Those who participated in the course were reimbursed for the cost of tuition. Some applied their earned credits toward an associate degree.

The project emphasized the crucial importance for each support person to develop a close working relationship with the sponsor teacher, and the staff made themselves available for team, group and individual counseling. Of the total group of participants, seven were employed as guidance support personnel; others became teacher aides, resource center aides, and support personnel in other school functions.

The project continued through a third year, during which 54 support personnel maintained their enrollment. The following were the reasons persons left the program:

1. Refusal of a school district to allow the trainee to continue training.
2. Change of residence.
3. Acquisition of the necessary skills for a job with resultant employment.
4. Enrollment as a full-time student in college.

Supervision

Zimpfer (1971) makes the following recommendations in regard to the supervision of support personnel in guidance programs:

1. Only one person, preferably the counselor, should provide immediate supervision. Such supervision might include task assignment, counseling, supportive assistance, and needed inservice training.

2. The supervising counselor should hold periodic conferences with the support personnel team, during which times the team might evaluate past activities and make preparations for future events. Such conferences should focus on how the counselor-support personnel team might best facilitate the growth and development of the students in the school.

3. The supervisor should attempt to guard against the inappropriate use of support personnel in duties that are unrelated to their guidance jobs.

4. The APGA role statement for support personnel suggests that they might be utilized to supervise clerical personnel. If such assignments are made, they should be handled carefully by a professional supervisor, since rivalries based on tenure or status might occur.

The supervisor of the paraprofessional has major responsibility for creating and maintaining an environment in which the paraprofessional can work effectively (Bobbitt, 1969). This includes fostering a climate of acceptance on the part of other staff members which is conducive to the full development of the nonprofessional. The supervisor is also responsible for seeing that necessary supportive activities are provided, and for insuring that the paraprofessional has adequate space and the necessary equipment for carrying out his or her duties.

Evaluation

Each paraprofessional program should be evaluated according to the criteria for achievement of program goals that were established at the outset of the program. The

paraprofessional should be supervised and evaluted according to the functions that have been defined for that particular worker.

The evaluation process may be closely linked with the process of supervision. Yet in programs where the training process is one of on the job training and close supervision. such as in those programs advocated by Riessman. the supervision would become more a part of training than of evaluation. Such programs are wary of evaluation *per se*, for this function is likely to impair the relationship between the paraprofessional and the supervisor. Programs of this sort would stress a continual process of close supervision. advice-giving and support. and would probably not include a formal process of evaluation of the trainee. There would. however. be evaluation of the total program.

In other types of programs in which trainees undergo a preservice training period evaluation criteria and processes would probably be more formal. but evaluation methods would differ greatly depending on the program. College training programs might evaluate trainees according to their performance in classes. Other programs might establish lists of various kinds of criteria by which to conduct evaluations. The majority of the paraprofessional evaluation processes. however. indicate agreement on certain basic factors of importance. Generally. it is agreed that evaluation should be a continuous process; should be concerned with both the performance and the progress of the nonprofessional; and should be based upon program goals. the workability of the program. and the effects of both the program and the nonprofessional upon student. professionals. and the nonprofessionals themselves.

The area of superivison and evaluation is one in which conflicting viewpoints exist. Programs which extend the greatest responsibility and independence to the paraprofessional tend to deemphasize supervision and evaluation and are likely to have mutual professional-nonprofessional evaluations. Other programs which accord the paraprofessional less responsibility and operate on the belief that he or she needs constant guidance and assistance are more apt to stress the importance of close supervision and thorough, periodic evaluation of paraprofessionals.

Problems and Dangers

A variety of problems may arise in attempting to implement paraprofessional programs in schools.

For school administrators. Administrators will find themselves faced with such decisions as establishing fiscal policies; setting up new hierarchies for positions; determining job descriptions. titles. salaries. increments and training requirements; determining who will train the nonprofessional.

For teachers, guidance counselors, supervisors. Such professionals are frequently concerned with the maintenance of professional standards and are fearful that administrators will assign nonprofessionals tasks that require professional skill. Teachers also want to be sure that class size will not be increased as a result of the addition of nonprofessional workers. Professionals are concerned that adequate school time be set aside for planning with and evaluation of the nonprofessionals. Some feel apprehensive about the presence of another adult in the classroom or counseling office.

Gordon (1965) states that both the institution and the professional must clearly identify the way in which they intend to incorporate support personnel. Warning against using paraprofessionals in full counseling (or teaching) capacities. which he believes should be reserved for professionals. Gordon sees a potential danger in using nonprofessionals in activities that require the expertise of fully trained personnel. In addition Gordon. along with Fisher (1968). suggests that use of paraprofessionals might have the effect of diluting professional standards.

For support personnel. Many nonprofessionals are self-conscious about differences in their backgrounds and speech patterns. Sone are resentful over the fact that they work as many hours and often at the same tasks as professionals and yet receive less pay. Support personnel sometime are uncertain about their role definitions. and the lack of an established procedure for occupational advancement and promotion.

On a broader scale. specific practices may develop that pose a threat to the entire concept of paraprofessionalism as it has been ideally conceived and implemented. Such practices include the following:

1. The paraprofessional may be absorbed by the educational system and provide services that are only more of the same. without being allowed to contribute to change in attitudes or methods of dealing with students. thereby perpetuating the system.

2. The paraprofessional may be used as a one-way communicator to the community. representing and supporting the school rather than being a liaison person who can help explain the school and community to one another.

3. The school might be tempted to select only those persons who represent no challenge or threat to the system. rather than to choose workers who are truly representative of the population the school serves.

"It is quite possible that natural empathy, understanding or other personal qualities of nonprofessionals might equal or excel those which the professional obtained through training."

4. Competition, lack of defined roles, unaccepting, threat of displacement, or unfair conditions of varying sorts may create tremendous tension and conflict between professionals and paraprofessionals.

5. Provision may be lacking for paraprofessionals to advance within the system.

6. The teacher's or counselor's tasks may be redistributed, with no true impact on a redesigning of teaching or counseling programs or practices.

7. Teachers who are given aides may be uncertain about how to use them advantageously and be unable to assume supervisory functions.

8. Paraprofessional positions may be created for the poor without any accompanying attempts to improve or restructure the curricula of the school.

9. The paraprofessional movement may continue in some areas with no effects on the relationship of the movement to significant change efforts such as decentralization and community control, restructuring of services to increase accountability, the Black Movement, the youth movement, and the new organizations of paraprofessionals.

Summary

Several authors, as well as professional organizations, have suggested guidelines for the use of paraprofessionals. Generally, they include such things as a clear statement of goals and objectives, adequate funding and training time, specific role definition, inclusion of all the staff in the recruitment of support personnel, specific outlines for content of the training program, adequate supervision, and ongoing evaluation. Selection procedures should be based on program needs, and the training should include orientation, on the job training, inservice education, supervision, and follow up. The supervisor should be the professional with whom the nonprofessional works and should include specific methods of evaluation, determined at the ouset of the program.

A variety of problems may occur as a result of the inclusion of support personnel in the professional setting, but many of these may be avoided if sufficient preparation is made by the designers of the program.

What's A Counselor

A PUPIL'S COUNSELING PRIMER

BY ANNA G. DODSON
ILLUSTRATIONS BY PERRIS JENNINGS

WHAT'S A COUNSELOR?

A counselor is a helper.
A counselor is a friend.
A counselor is the one
who lends a helping hand.
She helps all boys and girls,
Like you, and you, and me.

Sometimes she helps the teacher.
She helps the principal, too.
She can help Mom and Dad,
But most of all,
She likes to help those,
Like you, and you, and me.

She helps you when you are sad,
Even helps when you are mad.
She helps when you are lonely and afraid.
And whenever you do not know what to do,
She always tries to be a help to you.

She has a cozy room for you and me,
To sit down and catch be free.
Into this little room,
She takes boys and girls,
To have a friendly chat,
And all such things as that.

The counselor is the friendly one.
The counselor can help to make school fun
No need then, to run and hide;
for she can also be your guide.
The counselor will talk to you,
And she will also listen, too.

PARAPROFESSIONAL PROGRAMS IN HUMAN SERVICES

The following programs offer only a small indication of the wide variety of settings in which paraprofessionals are employed and the broad range of functions that they may perform. From California to Washington, D.C., from Maine to Florida, professionals are finding support personnel a valuable adjunct to their services. Included in the program descriptions are those including parents, teachers, students, and senior citizens–all attempting to provide a needed service to make the educational process more meaningful for young people and for the com-

munities of which they are a part.

Project Help, A Paraprofessional Program in Counseling

Rationale. A federally funded pilot program. Project HELP was designed to bring high school dropouts back into the school system and to reduce further attrition by responding to the needs of the potential dropout. Concern over the increased number of dropouts motivated several teachers at a large suburban high school to develop HELP—Help Education in Lincoln Park (Illinois). The three-year program sought to alter learning environments to make them more conducive to understanding, satisfaction, and growth. In the belief that dropping out is a response to socio-educational ills, Project HELP formulated the following objectives to change the socio-educational environment. Project HELP will:

1. Select a staff capable of dealing with the needs of potential dropouts and former dropouts.
2. Develop its staff to insure competence and cooperation in an innovative program for assisting students.
3. Attempt to involve the community and the parents of HELP students.
4. Attempt to improve the competencies of teachers not directly involved in HELP.
5. Establish a referral procedure for assigning former and potential dropouts to teachers in the program.

Thirty of the school's 125 teachers formed the core of the program, each volunteer expressing the desire to assume a new role. Thus, in a school setting with a population of 3,000 students, the HELP teachers were professionals serving in an added capacity as paraprofessionals. Other school staff included eight counselors and six administrators.

Selection Procedures. Teachers interested in becoming part of the HELP program submitted in writing their philosophies of education and records of their backgrounds and experiences. Final selection of personnel was based on evaluation by the school administrative staff, a university counseling consultant, and the five teachers organizing the program.

Procedures. Data collected over the three-year period of Project HELP's operation led to the following conclusions:

1. The helping teachers developed basic counseling skills. Self-exploration proved to be an effective way to assist teachers to establish meaningful relationships with students.
2. The program had significant positive influence on the number of dropouts who returned to school.
3. Students involved in the project responded favorably to the individual attention and the feeling that at least one person really cared.
4. The program was an effective way to augment a counseling program.
5. The program demonstrated that teachers with no previous counseling training could be helped to develop the skills necessary to cope with the problems of dropouts. (Source: Perry, 1973)

The Use of Teacher-Aides in Colorado Schools

Rationale. In an effort to improve the effectiveness and efficiency of teaching and learning, the Colorado State Board of Education encouraged local school boards to employ the services of teacher aides. Each aide was to work under the supervision of a teacher, who would assign classroom responsibilities based on the areas in which help was most needed and on the competencies of the aide. It was hoped that the assistance of aides would enable teachers to spend more time analyzing student needs and improving educational experiences.

Selection. Teacher-aides came from a variety of backgrounds. Aides with elementary school education were used with positive results, and these persons were encouraged to work toward passing the General Educational Development test and to attend junior colleges. Many aides were high school or college graduates. Local school boards formulated policies governing the selection, employment, assignment, and pay of aides. A school with a particularly large number of applicants for teacher-aide positions was able to request that the Colorado Department of Employment do initial screening.

Several criteria were considered important in selection. Applicants should exhibit the belief that every child can learn; they should be flexible and able to react well under stress; they should be able to communicate easily with adults as well as with children. Placement was based on the types of pupils and community to be served. Often an aide worked in a general capacity at first, assisting several techers, until a specific teacher requested the aide's services.

Procedures. A preservice education program for aides was planned cooperatively by an instituion for higher education, the school district, the professional staff of the school, and the aides themselves. The program provided knowledge and understanding of children and of ways in which the aides might work most beneficially with them. Preservice education included role-playing simulated experiences, films, and presentations in other media. A suggested outline includes human growth and development, the school and society, the educational team, skill training, goals for the school, and professional ethics. It was suggested that teachers participate and that at least 60 hours be devoted to preservice training.

The preservice program was followed by inservice education designed to enable aides to enter service at any level of preparation. Provision was made for those aides who had not completed high school to take the high school equivalency test. The inservice sessions were of two kinds: direct job orientation and college programs leading to professional certification.

The role of the teacher-aide requires continuous evaluation; it changes according to the changes in society, the school, and the individual aide. Outlining a specific job description was thought to be apt to set limitations which were too rigid. Aides were allowed to perform any task not requiring a professional. They might assist in the classroom, in home-school interaction, in counseling, in resource center or library services, in technical services, and in general school services.

Discussion. Evaluation of each teacher-aide program was based on the program objectives. It was believed that any system of evaluation should include all of the personnel working in the program, and the results should be made

available to all participants. Evaluation methods included interviews, observations and questionnaires. Relevant information was gathered through an examination of the activities performed by professionals and nonprofessionals and from feedback on the amount of interaction between aides and children and between aides and parents. The Elmont Project—Teacher-Moms For Troubled Children

Rationale. The Elmont School District of Nassau County, Long Island, initiated the Project for Exceptional Children to provide an organized educational facility for disturbed children who cannot function effectively in normal classrooms. The aim of this program, in operation since the 1959-60 school year, is individualized education within the educational framework rather than in special classes for emotionally and mentally handicapped children. It is based on the belief that all necessary resources for teaching these children exist in the educational system when professional planning is combined with community effort.

"Teacher-moms" are the key element in the program. Working with an educator, a psychologist, and a psychiatrist, each teacher-mom devotes her skills as mother and child-rearer to one disturbed child. The relationship developed between a teacher-mom and the child assigned to her is based on strong emotional rapport, and this relationship becomes the vehicle for learning.

Selection. Teacher-moms represent a wide range of ages and backgrounds; they are a cross-section of mothers in the community. All have reared their own children and volunteer their services. Most of the women are chosen for their extensive experience as mothers.

Procedures. All of a mother's skills are useful to her in her capacity as teacher-mom, but no blueprint is designed for her to follow. Teacher-moms receive little training or indoctrination in their roles. Trial and error, guided by judgement and intuition, contribute to a teacher-mom's effective functioning. The critical factor for the success of the program has proved to be the child/teacher-mom relationship which evolves first on a feeling level, then a trust level, and finally on a teaching and learning level.

During a routine day a teacher-mom greets her child on arrival at school. After leaving the child's coat in the room shared by the two of them, they proceed to a "good morning" room. While a professional teacher conducts groups opening exercises with the children, teacher-moms prepare materials for the morning. The teacher-mom teaches in subject areas such as reading, arithmetic, social studies, language skills, and science until mid-morning. After a snack break for all the children and teacher-moms in a large room, teacher-mom and child continue individualized work. All the children return home at noon.

The teacher-mom may decide at times to remove the child from the group environment. Special group experiences in music, arts and crafts, or games are scheduled occasionally. All instruction is mixed with talks, walks, records, and games.

Discussion. By 1968 a total of 31 children had been included in the teacher-mom project. Twenty-one of them had been successfully returned to regular classrooms, and one moved to another district as a part-time student in a regular classroom. A follow-up of these children indicates that they made accelerated emotional and educational progress in community, home, and school settings. Because the project educates troubled children within the existing educational framework it avoids the problems of separation and re-entrance into the community. The project demonstrates how community resources may be mobilized to sustain disturbed children emotionally and educationally at a per-pupil cost only slightly higher than the cost of traditional classroom education. (Source: Donahue and Nichtern, 1965)

The Use of Community Volunteers in the Elementary School

Rationale. In 1968, Auburn, Maine, school officials instituted a program which uses community volunteers as counselors of elementary school children. The program responds to the needs of large numbers of children for stable adult support in their education. The Auburn school system employs two elementary school counselors and a part-time mental health consultant, but funds do not allow for further expansion of the guidance staff. To increase services, the school system turned to the community for help.

The role of the teacher-aide requires continuous evaluation; it changes according to the changes in society, the school, and the invidiual aide."

Selection. To create interest and support for utilizing lay people as an intergral part of public education, the project director and mental health consultant distributed a pamphlet describing the program to local service clubs and church groups. In addition, the mental health consultant offered her services as speaker to interested community groups.

Adults who wished to participate were screened in an interview with the mental health consultant. The most successful volunteers proved to be those evidencing a sincere desire to become part of the program and to be of service to children, and those with a sense of humor, an understanding and acceptance of children, enthusiasm, flexibility, and a well-balanced personalilty.

The consultant and project director matched each re-

ferred child with an adult, after which each volunteer met with the consultant a second time for a briefing on the child. School principals introduced the volunteers to teacher and child and provided time for the teacher and volunteer to consult about the child's needs, reactions to certain tasks, interests, and current level of functioning. The schedule of volunteer-child contacts was determined by the teacher, principal, and consultant.

Training of Volunteers. The project director and mental health consultant conducted ten monthly seminars as inservice training for volunteers. All sessions emphasized discussion and member-to-member interaction; volunteers were encouraged to express ideas and concerns and to react to printed material, films, and brief lectures. The guidelines suggested by Cowen (Cowen, Gardner and Zax, 1967) formed the basis for the seminars. The sequence of seminar topics follows:

Session	General Objectives
1 The Auburn Project	To provide volunteers with an overview of the program and its objectives
2 Classroom observation	To allow the adults to view the classroom environment and meet with teachers as co-workers
3 Development of the normal personality	To provide instruction in basic concepts of child development
4 Role of the volunteer	To offer the adults guidelines for their work
5 The volunteer and the teacher	To clarify adult and teacher roles in the learning process
6 Observation of experienced volunteer	To demonstrate useful techniques
7 Methods of teaching	To develop teaching skills for academic activities with the children
8 Parent-child relationships	To suggest probable influences of family on child
9 Motivation	To emphasize that children operate at different motivational levels and that love and a feeling of worth are necessary preconditions for learning
10 Evaluation—held each May	To review the year's work and offer suggestions for change

Volunteers at Work. In this program the process of providing individual help for a child is viewed as a team effort involving teachers, administrators, project director, and the mental health consultant. In each referral the teacher initiates the procedure by completing a form of basic data on the child—including the reason for referral, background information, strengths and weaknesses, and current level of functioning. The mental health consultant screens referrals and makes recommendations for subsequent activities. If a child seems to need individual help, he or she is matched with a volunteer worker. Child and adult then meet regularly for periods of two to five hours a week during the school day. Some children remain with a volunteer for a few months; others continue for as long as a semester or a full year. In a few rare cases volunteers and children have met regularly for two years.

Volunteer activities with the children include discussion of mutual interests, reading stories aloud, gameplaying, review and completion of school assignments, engaging in arts and crafts, and taping stories on recorders. Emphasis, however, is on the relationship aspect of the child-volunteer interaction. The adult is not considered a teacher-aide or tutor even though some activities may be similar to those of a teacher.

Evaluation. Although no formal evaluation was made the first year, teachers and principals reported that the majority of children who met with volunteers showed improvement in grades, attitude toward school, behavior, and general appearance. Teachers noted that the most positive contributions of the adults were in caring for the children, making them feel worthwhile, listening to them, encouraging them, and stimulating them.

Through discussions with teachers and volunteers, a number of problem areas were identified and strategies designed for dealing with them.

1. Despite careful attempts to screen children and match them with adults, some mispairing occurred although a child need not be considered a "problem" to be eligible for assistance, volunteers occasionally questioned referrals because a child "didn't seem to need help." Some adults encountered difficulties with aggressive children; others had trouble relating to slow learners. A few reported that shy or withdrawn children posed problems. Many adults displayed a low tolerance level for ambiguity and reported feelings of frustration when change in a child was not readily apparent. Teachers noted that a few of the volunteers tended unconsciously to project their own difficulties on the children. On the job supervision by a professional staff member was concluded to be an essential component of the program.

2. The most frequent complaint of teachers and volunteers was that time for communication between them was insufficient. Incompatible schedules forced some to maintain communication by telephone or letter. Because feedback sessions between teacher and volunteer concerning an individual child's progress were essential, the Auburn group recommended that part of inservice and parent-conference days be devoted to teacher-volunteer meetings.

3. Although the "possession phenomenon," the tendency of the educator to consider the child as "mine," did not occur frequently in the Auburn program, it was occasionally a problem. A teacher might resent the intrusion of another adult in his or her classroom and remain skeptical about the philosphy and usefulness of the program. Community opposition might also arise. To insure teacher and community support, all parties must be kept well-informed; teachers must be integral to the referral

process. Further, they must realize that most children believe the teacher is responsible for finding them an adult friend.

Discussion. The use of volunteers presupposes that all of the children who want and need individual guidance cannot be helped within the context of existing guidance programs. It is assumed that work with children who are basically normal is not the exclusive domain of the psychologists, social worker or counselor. Direct intervention in the life of a child is believed to be an effective way to promote individual development even when the intervention is not made by a trained professional counselor.

While the Auburn program was originally developed to assist handicapped children, the developmental potential has not been overlooked. A child need not be troubled in order to be part of the program. The normal developmental concerns of a maturing child may be sufficient reason to pair a child with an understanding volunteer. In fact, it is desirable that a number of well-adjusted children be referred in order that the program avoid a problem-centered label. It might also be beneficial to design a program allowing all children to visit with a volunteer at some time during the school year. A further outcome of the use of volunteers is the possibility of the helper's being helped. The love and acceptance of children seem to contribute to increased adult vitality.

The Auburn plan now operates in many elementary schools. The scope of adult volunteer program, however, need not be limited to work with pre-adolescent children. Heavy case loads and a shortage of trained counselors plague secondary schools as well. Activities and approaches would need modification to meet adolescent needs, but imaginative counselors should encounter little difficulty in developing appropriate experiences for older children. (Source: Muro, 1970)

Student Volunteers as Freshman Counselors

Rationale. In 1970 the University of Florida developed the Student Volunteer Program to respond to the need for more active student participation in the academic community and for a curriculum more relevant to student life. The program assumes that students can effectively teach their peers and that today's students are motivated by the ideal of altruistic service to others.

The Student Volunteers in this program are college sophomores who devote time and effort to helping incoming freshmen adjust to the University. The recruitment goal of 200 was chosen to provide a minimum ratio of one Student Volunteer to twenty freshmen. The volunteer assists with orientation, serves as a resource person and friend during the year, and acts as a referral agent for various other resources on campus and as a consultant to the residence hall staff.

Selection. Counselors in nine residence areas interview potential volunteers during the spring quarter. They seek students committed to the program. Volunteers must be willing to enroll in an academic course for volunteers and be able to spend the time necessary to fulfill the functions of the job. Ideal Student Volunteers are those who relate easily to people and are likely to be trusted as friends by the freshmen.

Description. During the fall of the year the volunteers enroll in a three-credit pass-fail course entitled, "Student Development in a University Setting." A team-taught one hour a week lecture combines the efforts of a counselor educator, a personnel administrator, the director of residence halls, and a variety of other resource people from within the University. Lecture topics include:

Volunteer Characteristics—Who Are We?
The Helping Relationship
Drugs on Campus
Freshman Characteristics
The Black Student at the Univers ty
The Role of the Student at the Un/ersity
Human Sexuality
Insights—Synthesizing the Helping Experience

The second hour each week is spent in small discussion groups headed by residence hall counselors. The groups provide an opportunity for the volunteers to discuss and evaluate material presented in lectures. Role playing and other communication techniques are often used in the group sessions. Groups also visit various campus services.

During the third hour of the course, the volunteer works with a group of freshman students. Each volunteer develops a plan for activities with his section instructor and then carries it out with the students. Often plans are developed within the student group itself, such as going out to dinner together or meeting in study sessions prior to exams. The volunteer generally lives on the same floor in the dormitory as the members of his or her group, and thus many informal group activities are possible. Volunteers are encouraged to maintain a friendly informal atmosphere with the students.

Bi-weekly conferences with the section instructor emphasize the volunteer's skill development. A major purpose of the course is for the Student Volunteers to understand and use course material in helping freshmen, and the volunteer is encouraged to consult with the instructor about any special problems.

Discussion. After operating for a year the program was evaluated by Student Volunteers and section instructors. The evaluation brought about several revisions in the program for the next year.

Current Student Volunteers would aid residence hall counselors in interviewing and selecting prospective volunteers. The course would change from large lectures to smaller groups and more informal presentations. Section instructors would be responsible for presenting material. The course lecturers would become resource people and coordinators of the total program. Experience showed that time is limited when volunteers are enrolled in the course at the same time they are involved in activities with freshmen. Therefore, the course would be offered during the spring semester. (Source: Jeffers)

Peer Counseling Offices at the University of Michigan

Rationale. Perceiving the need for an information center for other students at the University of Michigan, three undergraduates established a Student Advising Office in the College of Literature, Science and the Arts in the spring of 1969. After witnessing the success of this endeavor, students in the University's School of Education set up a similar office.

Previous to the establishment of these offices, students commonly sought help from one another regarding school-related decision. Although faculty members at the University were assigned responsibilities for academic advisement, frequently they were new to the University and lacking in knowledge. As a result, students were often left to their own resources and were often uncertain or confused about procedures and programs. The student offices were established by students for students as a way of changing this situation.

Selection. Peer counselors work on a volunteer basis, and there are no requirements for counselors other than their own interest and desire to counsel. The program coordinators are paid workers who usually work about 20 hours per week. They are selected through informal polling of the counselors. Final decisions on the new coordinators are made by old coordinators.

Description. Faculty and administrative counselors lent their support to the Student Advising Offices, and now the offices receive minimal funding for the salaries of the coordinators and for basic supplies. The offices are indirectly responsible to a dean or executive committee. A feeling of mutual support exists between the Student Advising offices and the traditional counseling services.

Student offices are informal and operate on a walk-in basis, without scheduled appointments. A counselor is

available at all times during office hours, and counseling is done both individually and in small groups.

Coordinator responsibilities include scheduling student counselors, keeping files of university materials, counseling, and coordinating activities. The coordinators also schedule orientation meetings in which resource people are brought in to share special information and knowledge.

Most counselors begin by counseling for two hours a week, increasing gradually to ten or twelve hours weekly. Although student counselors receive no formal training, resources are available to them. Their offices are equipped with University counseling manuals, the book of standard operating procedures for the University, course outlines, and course evaluations. Counselors gain skill and knowledge by observing and talking with other counselors and by actual counseling. The offices do whatever they can to respond to the needs of the students who seek their help. Often students go to the offices just to talk. If a student wants information about which a counselor is uncertain, the counselor makes every effort to find it. If counselors or other members of the staff feel unable to handle particular problems, they may refer students to other services on campus or in the community.

Discussion. In 1970 student counselors helped an estimated 75 to 100 students per week. The counselors feel that their reception and success is a result of their enthusiasm; they believe strongly in what they are doing and in how they are doing it. One coordinator evaluated the program in the following way:

> To put it very bluntly—I don't think you can get the honesty anywhere else in the University that you can get in our office. Many students are discouraged because they know what they want, but aren't able to get it—they don't know how to get around the red tape. We try, in a positive way, to help break down the notion that you can only approach the University in one way. I guess you could say we help them to learn how to manipulate their environment.

The success of the two pioneering Student Advising Offices has inspired the establishment of other peer counseling and advising centers on campus. Some of these now function in the School of Engineering, the School of Natural Resources, and in several dormitories on campus. (Source: CAPS Capsule, 1970)

The Use of High School Students to Enrich an Elementary Guidance and Counseling Program

Rationale. One of the goals of an elementary guidance program is to help children learn to relate more appropriately to their peers and to adults. In order to accomplish this, the child must come to believe in his or her own personal worth and have confidence that he or she is an adequate person. The proponents of this program believe that more individualized, personal attention for youngsters experiencing difficulty in human relationships will enhance their self concepts and thereby effect positive change in their dealings with others.

A number of elementary school children appeared to experience this difficulty. To bring the benefit of counseling services to the greatest possible number of children, a program was designed to use high school students in one-to-one relationships with them.

The idea had potential value for the older students as well. The high school students would have the opportunity to discover how their services could help meet a small child's needs for attention, encouragement, personal acceptance, and recognition.

Selection Procedures. Twenty-five elementary school children (14 boys, 11 girls) were selected by the fourth, fifth, and sixth grade teachers. Some of the children had had previous contact with a social worker but no longer needed case work service. None of the children were receiving psychiatric treatment. They were marginal performers who needed a friend, a push, motivation—or just someone they could trust. Some of the children were known to have minimal communication at home or school; some were unduly shy with peer groups. Others were noticeably ambivalent about school, often reflecting home attitudes. Still others had problems with personal grooming. There was marked variation in talents and kinds of problems presented, but all the children needed the concentrated attention of an older person with whom they could communicate. Parents of all participating elementary and high school students were informed of the program and gave permission for their children to take part.

The selection of high school students was conducted by the Student Council sponsor. Each student volunteer had indicated an interest in working in the field of teaching, social work, or mental health; and each was considered sufficiently mature to fulfill a responsible role in the program. Among the group selected were the class President and Vice-president, President of the Student Council, and leaders in wrestling, swimming, and baseball. In general the volunteers came from more advantaged homes than the elementary school children.

The elementary and high school students were matched by the Student advisor in cooperation with the elementary school staff. Comments from the cumulative records and teacher recommendations as well as brief personality sketches were shared. The pairs were of like sex and as homogeneous in background as possible.

Program Procedures. No special program training activities for the high school counselor-aides were designed. However, they received specialized guidance throughout the period during which they were meeting with counselees. Before meeting the elementary students, the high school participants were briefed on the scope of the project, various behavior patterns they might expect, and the rationale for selection of children for the program. They shared their feelings of anticipation and concern, and the sponsors and advisors helped structure goals for each elementary school child, stressing that goals would change as relationships developed.

The elementary children were introduced to the plan as a group. Each child understood that he or she was participating in a program designed to help young children become happier in school and more interested in their work.

High school and elementary school students then met at the elementary school along with the elementary teachers, a guidance worker, and a social worker. At this meeting the paired students set up a time and place for their subsequent meetings, and the high school students questioned the classroom teachers about their young

". . . improved self-concept may be manifested in may ways and is more easily perceived in some children than in others."

charges. The elementary children were excused from class 45 minutes a week to meet with their high school friends. They ordinarily met in pairs and occasionally in groups of four or six. The weekly sessions were used for academic assistance, athletic play, or just talking.

All-group programs included an Easter-egg hunt and picnic during spring vacation; a visit to the high school with lunch in the cafeteria, a visit to a class and a Student Council meeting, and a tour of the building; a volley-ball game; and a final party. These all-group functions added greatly to the understanding that the older students had of the younger ones, and they were judged to be helpful to withdrawn children, who learned to participate more freely as their confidence increased in their high school friends.

Group discussions involving the older students were held bi-monthly at the high school, covering such topics as how do deprived children express themselves, how do we percieve change, what is the meaning of hostility or excessive demands? Toward the end of the year the problem of separation was considered at some length. The meetings provided a forum for student volunteers to share their feelings of achievement, frustration and uncertainty and an opportunity to consult with the guidance worker.

Evaluation and Followup. On the subjective level, it was easy to perceive the growing warmth, companionship, and enthusiasm that characterized the sessions between the older and younger students. An increased amount of affection was displayed and marked enthusiasm was shown by some of the children who had been quite shy previously. School behavior improved noticeably for some, and many began to take more pride in personal appearance and hygiene.

For more objective evaluations, teachers and parents of the elementary students who participated in the program were asked to complete rating scales. The high school students were asked to evaluate the program by submitting an essay about their reactions. The elementary students met as a group to discuss their reactions.

Parent Evaluation. The parent evaluation scale asked for responses to such items as:

1. Evaluate pupil's behavior at home since entering the program.
2. Has pupil's attitude toward brothers and sisters improved?
3. Has there been any change in your child's attitude toward school?

On both parent and teacher evaluation sheets the rating categories read: Greatly Improved, Somewhat Improved, Same, Worse. It was noted that 77% of the total responses were Somewhat Improved or Greatly Improved.

Significantly more Improved responses for girls than for boys were noted in home behavior and attitude toward siblings, with a similar trend in attitude toward school. All parents indicated that they wanted their children included in the program again.

Teacher Evaluation. Teachers were asked to respond to the following items:

1. Evaluate pupil's behavior since entering the program.
2. Has pupil's attitude toward peers improved?
3. Evaluate pupil's attitude toward school.
4. Evaluate pupil's attitude toward teacher.
5. Has there been any noticeable improvement in pupil's study habits?

Teachers observed fewer areas of improvement, proportionately, than parents. Only 43% of teacher responses were in the Somewhat Improved or Greatly Improved categories. Teachers perceived greatest improvement in the children's attitude toward the peer group.

High School Student Evaluation. The high school students agreed unanimously that the program was worth while. "It was so rewarding to me to see Karen open up," and, "Bob learned to get along in a group without needing to have things his way," were among typical comments. The students made suggestions for improving the program next year. "Give more complete information about the elementary students before initial meeting." "Make better arrangements for space in the building." Have more total-group activities." The students also commented on the personal rewards of the project. Knowing someone is depending on you gives you a feeling of responsibility and discipline." "Glad to be able to help somebody—not just talk of ideals." "Valuable because it helped me to use patience and to slow down and try to help someone." All of the high school students hoped the program would be continued.

Elementary School Student Evaluation. Without exception, all of the elementary school children felt that the program had been helpful. Reasons varied from delight in getting out of class to, "It was wonderful to have someone to talk to...someone to help me with my work... someone to give me some advice." Some of the children felt that spending more time on academic matters would be useful. Others wished that the high school students would come more than once a week. Boys and girls appeared to be equally articulate and enthusiastic.

Discussion and Recommendations. Girl-boy differences in project results may be attributed to several factors. The most apparent was the girls' tendency to verbalize more freely and to show outward affection and excitement in contrast to the more reserved manner of the boys. Also the

girls' problems may perhaps have been of a less serious nature at the outset, through the initial referrals to the program did not support such a bias.

It should be stressed that the statistical results highlight only the most clear-cut findings. For some children only certain areas were in need of improvement, so a rating of Same did not necessarily denote inadequate adjustment or that the relationship with the high school student was not helpful. The Worse notation for one girl was explained by her teacher as noting a very positive change; the child progressed from being severely withdrawn and overly complaining to being silly and social and casual about her work.

The fact that the teachers noted the greatest growth in the Relation to Peer Group category appears to tie in directly with the basic purpose of the program. It supports the working hypothesis that a child's peer relationships will improve as the result of a trustworthy, meaningful relationship with another person.

The subjective evaluations indicated that improved self-concept may be manifested in may ways and is more easily perceived in some children than in others. The older students readily acknowledged that they benefited from the training and guidance they received as they learned to become significant to an emotionally deprived child. At no time did the elementary children appear jealous of another's companion, nor were there systematic complaints or disappointments.

All but two of the teachers involved endorsed the project and thought it should be continued. Various factors qualified teacher enthusiasm. Some teachers resisted the change in established programs—perhaps because of new demands on them, perhaps because of feeling displaced by the high school students, perhaps because they felt that the students should have sought more specific direction from them. To minimize faculty resistance the potential of encountering problems such as these should be discussed and understood during faculty orientation at the beginning of the program.

Faculty should be helped to appreciate the intangible and covert goals as well as those more readily observable. More explicit goals—including parental goals—for each elementary student could be established. These goals might include solving problems related to dependency, attention-getting, withdrawing from other children, dominating others, destruction of others' property, provoking others, overacting, inadequate personal hygiene, lack of affection, or disrespect. Evaluation of these goals could be handled in checklist fashion at the conclusion of the project.

In planning for fuller appraisal of the project in forthcoming years, other objective criteria might be considered. These could include absentee rate before and after the relationship with the high school friend was established, changes in academic grades, comparison of ratings on evaluation scale items with a control group of students matched for problem areas, and before-and-after projective tests such as sentence completion.

The observed movement toward greater self-acceptance shown by these elementary school children as a result of the effort, understanding, and loving companionship of high school students appeared to support a program using older students as adjuncts to an elementary school guidance and counseling program. In these days of overcrowed schools and increased case-loads it appears to be worthwhile to use counselor time to develop the resources of non-professional aides such as mature, responsible high school students. (Source: Winters and Arent, 1969)

Using Teenagers to Supplement Casework

Rationale. Designed along the lines of the Big Brother programs found in many U.S. communities, the Champaign, Illinois, program used teenagers to act as "Pals" for youngsters. A teenage youth council and a school social work department co-sponsored the experimental project which is supported by an NiMH grant to the Champaign Human Relations Commission. Program goals and structure were developed in accordance with the fundamentals of professional social work practice to supplement available services. The Pal program attempts to supply services other than casework to children who might benefit from a relationship with an older person.

Because the teenager is closer to the child in age and more likely to participate in the same activities, the child is less likely to associate the teenager with the adult world and is more likely to identify with him or her. The teenagers operate with minimal autonomy, and clients are selected on the basis of low vulnerability to possible damage from a relationship with a nonprofessional.

One basic assumption of this program is that the teenagers would benefit from it as much as the clients. It was hoped that fulfilling the needs of children who depend on them would improve the teenagers' sense of personal identity. The experience would contribute to the teenagers' maturity through the focus on giving to and thinking of others. In addition the experience would introduce the volunteers to the field of social work.

Selection. The teenage participants were chosen through formal applications which asked for personal information and references. Interviews were held, and eight participants were chosen. The teenagers were required to be over 16 years old to minimize problems of identification and confusion between clients and paraprofessionals.

Children taking part in the program were recommended either by a social worker or by a committee of a teacher, principal, psychologist, and social worker. The children chosen were felt to be in need of an adult with whom they could identify and a human relationship outside the family. They were selected primarily on the basis of a positive response to the offerings of the Pal program. The age range was limited to six through ten. Children with behavior problems such as aggressive behavior or "acting out" were not included because the teenagers were not prepared to deal with such problems. Eight children participated.

Procedures. The Pals met with their youngsters for half a day each week. Each Pal was responsible for preparing several activity suggestions for each session and was encouraged to involve the youngster in the planning. Activities ranged from ice-skating to museum visits to window shopping; most activities were free or inexpensive.

Volunteers were closely supervised. Each Pal was assigned a supervisor with whom he or she was expected to consult frequently, and all Pals attended monthly training sessions. The first training session provided an orien-

tation to the professional nature of the program. The meeting focused on behavior characteristics of children in relation to age and socioeconomic situation and the teenagers' feelings regarding the child client, parents, and themselves. The Pals talked out anxiety which the children might be feeling and about their own apprehensions. Subsequent training sessions also gave Pals a chance to discuss questions, problems, and reactions.

Each Pal was assigned for one year only, to avoid strong emotional relationships. All interagency discussion was handled by the caseworker and the group supervisor. The supervisor worked with the teenagers while the caseworker worked with the client. Caseworkers did not have direct contact with Pals; however, caseworkers wrote monthly reports for their clients' Pals with evaluations and suggestions.

Discussion. During the final group meeting the teenagers evaluated the program and agreed that they had benefited from the program as much as the children. They felt that the experience exposed them to different socioeconomic situations and problems. The program supervisors believed that the experience developed the volunteers' emotional maturity, ability to establish meaningful relationships, and capacity to give. Supervisors and program designers emphasized the necessity that similar programs be carefully designed. (Source: Perlmutter and Durham, 1969)

Training Parents as Drug Counselors in the Community

Rationale. The parents in a community felt that traditional educational lectures on drugs and public panel discussions by doctors, lawyers, and former junkies had not been successful in helping community members to solve personal dilemmas. So parent-volunteers designed a program to utilize community personnel to help other parents whose children were having drug-related problems.

Volunteers were trained to become "community developers," a term describing a person capable of providing a unique service to the community—a person with a full sense of personal competence who acts as a competent individual rather than as the servant of a professional. Parents became community developers in the program, but student peer counselors and community hot-line workers could serve as community developers in other stuations. The goals of the parent training program were to educate parents about drugs, to train them in counseling and human relations skills, and to support them with follow-up services as they attempted to implement the program in the community.

Procedures. Volunteers participated in 60 hours of training. The first phase was a 20-hour weekend encounter group structured to get people to know each other better, promote individual openness and sharing, identify problem areas often encountered in counseling, and develop observational techniques. The weekend encounter identified the desire for personal growth experiences and the desire to serve the community as two factors motivating the parents.

The second phase of training focused on providing parents with drug information and teaching them counseling skills. A university-associated drug program presented lectures and facilitated discussions on drug information. In microcounseling—a technique which emphasizes interviewing skills—parents concentrated on attending behavior, reading non-verbal clues, reflection of feeling, paraphrasing, and summarizing. Participants practiced these skills individuallly and in small groups, each person having an opportunity to act as client, counselor, and supervisor. The volunteers showed improvement in their ability to counsel. Audio and video equipment were incorporated in this phase of training, as were structured experiential exercises similar to those in the encounter phase. The feeling of group cohesiveness evolving from these first phases of training helped the group in its early period of work in the community.

The final phase of training emphasized community development and change techniques. Volunteers were urged to assume supportive or consulting roles when they began community work and to avoid fostering dependent relationships. Guidelines were established concerning plans or problems relating to the responsibilities of the community developers group, avoiding feeling directly responsible for the task or outcomes of counseling, and functioning in the context of what was taking place in the field.

After training, the group made it known that their services were available to parents in need of such support. As they became involved, participants in the program became more adept at organizing community activities and determining community needs. In the course of initial interactions with 100 clients, the community developers broadened their services to include marital-related conseling, parent-child conflict resolution, and a "Parent-to-Parent Call Line." Additional factual material and ongoing training helped volunteers become more effective in these newly developed areas.

Discussion. This program demonstrates the services which concerned parents can provide to help other families in the community. A follow-up study conducted by independent raters seven months after training showed that the community developers had maintained their skills in counseling and that they were having a significant impact on their clients. The parents acted as counselors who help to mold and make things happen

"... the child is less likely to associate the teenager with the adult world and is more likely to identify with him or her."

rather than as conveyors of information or collectors of data. Volunteers not only acquired new skills in counseling and interpersonal interaction but also learned new concepts of organizational development and change. Through helping others to clarify and seek new alternatives for gaining control over certain aspects of their lives, they ameliorated conditions in their community. These paraprofessionals became community developers in action. (Source: Gluckstern, 1973)

An Undergraduate Counselor Training Program

Rationale. Selected institutions of higher education participate in the Texas Plan, an intergrated undergraduate approach to the preparation of support personnel in guidance and counseling. An outgrowth of a Texas Personnel and Guidance Association task force, the plan builds on a competency-based guidance and counseling "career ladder." The career ladder presents three levels of systematic programming for guidance personnel —para professional pre-professional and professional.

The Paraprofessional Level. People working at the paraprofessional level begin on the career ladder as "intern guidance assistants." Interns have certain competencies from their high school or community college or adult education experiences. They are eager to learn and able to relate to young people. After an interview they receive a try-out position in a school guidance office as a clerk, receptionist, librarian or general office worker. They serve as intern guidance assistants for a period of one or two years, with or without salary.

Following internship and a thorough evaluation by the guidance staff, interns may become "contract guidance assistants." Contract guidance assistants may be expected to complete additional college work, adult education courses, or on the job training experiences. Renewal of contract is based on competency and pesonality attributes. Contract assistants need not seek the next level on the ladder but have that option. High school students may become helpers for interns or contract assistants, thus expanding training and recruitment possibilities.

The Pre-Professional Level. To become an intern guidance associate, the first-rung worker at the pre-professional level, one must complete an associate degree from a community college or a minimum of two years work at a college or university. While serving an internship a worker at this level enrolls in a junior-senior level training program for guidance personnel. The professional counseling staff supervise interns in school guidance offices.

On completion of the Bachelor's program in Guidance Studies and on recommendation by the professioal counseling staff, a guidance associate receives a contract. Part of the contract associates' job is to share the supervision of guidance assistants. Pre-professionals receive direct professional level supervision.

The Professional Level. On this level personnel must have a Master's degree in the area of guidance and counseling and the endorsement of the institution providing the training experiences. They must also be approved by the public school counseling staff who supervise the required in-school internship experience. The terms "counselor" and "professional" are reserved for workers at this level; professionals have been fully trained and are expected to have been fully trained and are expected to have developed special skills in certain areas. Counselors supervise guidance associates and provide direction for assistants.

With a specialist degree in counseling, one may serve as a Head Counselor, Team Leader, Director of Guidance, or Divison Chairman.

The final rung on the career ladder requires a doctoral degree in counseling. Personnel at this level may become leaders in the profession due to their training, personal qualifications, and experience.

Discussion. The Texas Plan changes counselor certification from a teacher-centered preparation base to a behavioral science foundation in counselor education. Clearly defined goals and objectives strengthen the program. Competency-based evaluations of candidates' performance and knowledge lead to certification. Stated in advance, the performance competencies are based on explicit concepts of guidance roles related to the career ladder. Time modules for candidates' developing desired competencies are systematically structured. People from other disciplines are provided ways to enter the program and develop and demonstrate competencies.

Short Models of Support Personnel Programs in Guidance

The Guidance Assistant Project in Deerfield, Illinois. This program involved the hiring of guidance assistants to work in elementary schools in Deerfield. The applicants were required to have under-graduate degrees and were screened by a committee of the school psychologist the project director, the mental health clinic administrator, the guidance director, and the school principal. Those chosen participated in a orientation program before school began. They received graduate course credit for in-service training conducted during the school year by the school psychologist and the school social worker.

The assistants' responsibilities included helping in the testing program, observing and gathering data, serving as resource people, and working directly with children—screening for kindergarten and first grade, conducting classroom group guidance, and making referrals. Evaluation of the program indicated success in many areas. (Deerfield Public Schools, 1968)

Baker's Dozen Community Mental Health Center for Adolescents at Howard University, Washington, D.C. As part of a program for training nonprofessionals for careers in the human services, eight youths, aged 17 through 21, were trained as mental health workers for neighborhood children. The three-month training program stressed development of personal motivation, clarification of values and identity, acquisition of basic social and interpersonal skills, and knowledge about working with groups and individuals.

The aides served as leaders of groups which provided activities aimed at ego-strengthening and therapeutic gains. They also participated in program planning, behavior observation, interviews with groups members, and individual and group supervision. (Mitchell in Grosser, et al., 1969)

Volunteer Activities in Winnetka, Illinois Schools. In this program senior citizens are recruited through public-

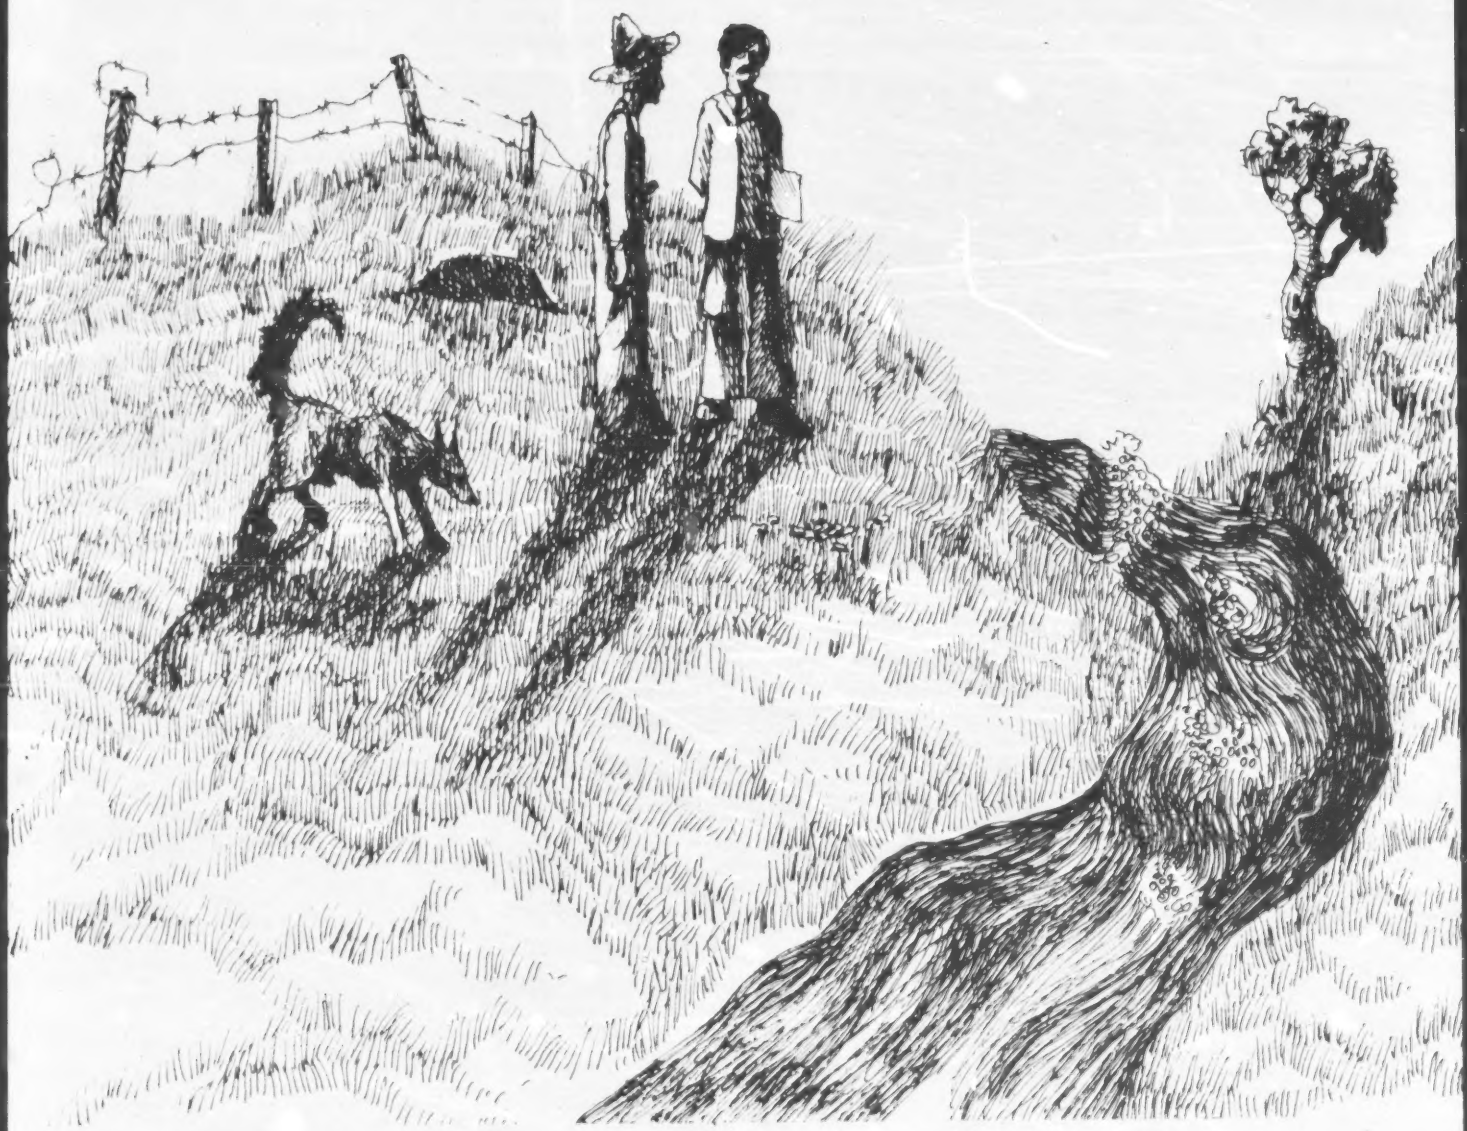
"Volunteers not only acquired new skills in counseling and interpersonal interaction but also learned new concepts of organizational development and change."

ity and contact with community organizations to do volunteer work in the schools. After interviews to determine their interests, experiences, and availability the senior citizens become part of a talent pool from which school coordinators can draw. In the schools they serve as curriculum resource consultants, special lecturers, teacher aides, and tutors in programs for special children.

The volunteers are supervised and evaluated by the program coordinator, who also maintains communication between school personnel and volunteers. The program has received funding and has been initiated in six other communities. (Freund, 1968)

Training Program for Support Personnel in Resource Centers and Guidance Offices. As a result of a grant from the U.S. Office of Education through the Massachusetts Department of Education, a three week full-time summer program was held to train support personnel. The 1969 program at Amherst Pelham Junior High School training 18 women to work as support personnel in school learning resource centers and guidance offices. The training program focused on developing skills in human relations, clerical skills, and skills specific to guidance offices or resource centers. The program was concerned with Level I training as described in Chapter One for the first three-week session, followed by skill-building sessions at Levels II and III the subsequent summer (Zimpfer, 1971). People were recruited through the distribution of brochures and news releases. Participation in the program was open to any person with an aide position waiting in the fall, regardless of previous education. However, people who had already been employed and who had jobs waiting in the same school were not eligible.

An interim study (Leland, et al, 1969) reported the outcomes of the program. The trainees were found to be functioning satisfactorily in their schools. They were supervised by staff members through visits during the year and through Saturday sessions. A strong follow-up plan involving meetings and supervision with an outside consultant was considered to be an important aspect of the success of the program.



5.

IMPLICATIONS & FUTURE TRENDS

Effects of the Paraprofessional Movement

While the paraprofessional has functioned for many years in fields of medicine, law, engineering and education, the movement to incorporate such services into school guidance programs is relatively new and is the cause of considerable controversy. Created as a result of several factors, including a shortage of professional workers and recognition of the need for more personalized counseling services for diverse groups of students, the paraprofessional role is still in the process of being defined. Support has come from professional organizations, state legislatures, state-level agencies and the Federal government, but guidelines are broad and nonspecific, leaving much room for interpretation by

employing institutions.

Several studies attest to the effectiveness of paraprofessionals in mental health services, and definite improvement in pupil learning have been documented in classrooms with teacher aides. Little formal evaluation of paraprofessionals in the counseling field has been conducted, however, and what evidence exists is in the form of either descriptive, subjective impressions, or checklists of reactions and observations. Even more rare is research that attempts to explore the reactions of students to support personnel in counseling.

A review of the literature will suggest some generalizations that may be made about the use of paraprofessionals in educational settings, some of which are listed below:

1. Many guidance and instructional activities may be successfully undertaken by support personnel.
2. Support personnel in schools have up till now primarily been used as teacher aides. Interest is growing as to other possibilities for such workers in a variety of areas heretofore limited to professionals.
3. Paraprofessionals may be employed by school districts either on a voluntary basis or as paid workers.
4. Inservice training for *all* school personnel is imperative when aides are introduced into a school.
5. Developing positions for nonprofessionals is often a way of creating entry-level jobs for members of the community.

The foregoing statements speak broadly to the use of the services of paraprofessionals and provide a background from which to view the specific effects of paraprofessional programs on the individuals, the communities, and the institutions of which they are a part.

Effects on the Paraprofessional

What happens to these nonprofessionals as they embark on their new careers in professional settings? What are the effects on the persons themselves as they perform new roles and interact closely with professionals who may have had totally different life experiences? The following report from a Richmond, California paraprofessional program speaks rather explicitly to this question:

> The program resulted in increased knowledge about the community and citizen participation, development of personal skills and potential changes in social and political outlook, and transformation personal identity.
>
> The consequence of finding a line of work in which one is competent and that gets rewarded socially is a clearer concept of who one is, of what is one's place in the world.
>
> The work of providing social services and the emerging role of community spokesman had these identity effects for many of the Richmond workers who did not previously have an occupational and community role or clear-cut notion of their social function . . . Previous moods of apathy and discouragement were replaced by productive activism and high morale . . . (Gartner, 1971)

Thus, the employment of the paraprofessional not only offers a response to genuine societal need but contributes to feelings of fulfillment on the part of the aide as well.

The Minneapolis New Careers Program attempted to examine the effects of their employment in professional settings on the self concept of paraprofessionals. The study revealed that significant positive changes occurred in the self concepts of paraprofessionals as a result of their work and association with professionals. In addition, the indigenous workers reported that they felt more comfortable with professionals and more familiar with professional practices. At the same time these changes were ocurring, however, the workers expressed increasing doubts about the expertise of the professionals and the efficacy of their functions (New Careers Research, 1969).

Reports from several programs indicate that paraprofessionals experience changes in their standard of living in a positive sense and evince new aspirations for continuing education and training. Some even terminated employment and return to school, thereby increasing their opportunity for career advancement.

Effects on the Professional

The paraprofessional may have a variety of significant effects on the professional with who he or she works. For example, the nonprofessional may be responsible for introducing the professional to a broader repertoire of counseling techniques of a preventive or remedial nature. Because the paraprofessional is often more familiar with the life style and needs of various kinds of students, he or she may be able to illustrate for the professional more adequate ways of responding to those students.

Teacher or counselor aides may enable the professionals to be more effective in their work by freeing them to perform tasks for which they are specially trained. The professional may thus be able to expand his role to that of consultant, organizer or supervisor and to become involved with evaluative techniques. The appropriate use of nonprofessionals will depend on the identification of competencies needed and the development of criteria for evaulating these skills. Professionals may be forced to develop competency-based programs in order to respond to this requirement.

An increase in the accountability of professional services may also occur. The paraprofessional can play a significant role as an agent for change, uniting his or her efforts with students and professionals to effect beneficial changes within institutions and programs. This can have the effect of making programs more relevant to need, revitalizing existing programs in line with emerging or changing objectives, and thus cause the professionals themselves to be more accountable in the services they provide.

Another possible effect on the professional has been refered to earlier in this report but is mentioned again because of its importance. Inclusion of paraprofessionals in counseling fields has the potential for creating feelings of insecurity and threat on the part of the professional which may lead to friction between the two groups of workers. The counseling profession is new enough that it is still establishing itself in the field of human services. This fact, coupled with budgets cuts resulting in a decrease of available jobs for professional persons, is apt to create resentment and fear that a dilution of standards may occur. Professionals are only now beginning to provide definitive answers to the old question, "What do counselors do?" and may as a result be forced to examine

their roles and describe them in concrete terms that are understandable and acceptable to a questioning public.

Lack of clear definition of roles of professionals and paraprofessionals can result in conflict. One effective way to achieve role definition is through a systems approach, which entails determining the overall purpose of the agency; defining the purpose in terms of specific objectives; and then identifying the various methods, personnel, and facilities needed to meet these objectives. The activities of an agency might be subdivided into task functions, such as support, interaction facilitation, and communication facilitation; and maintenance functions, which involve recruitment and training of personnel and the other administrative activities. Roles within both areas can be specifically defined and assigned to either professionals or paraprofessionals, thus clarifying responsibilities and alleviating confusion and overlap. Grosser (1969) comments on this need for role definition and possible change in patterns of performance when he says:

> The introduction of a program device as innovative as this one, even if the original intention is only to improve services, must soon produce strains leading to alterations in patterns of agency function.

Effects on Students

As mentioned earlier, some research evidence exists as to improvement of pupil learning in classrooms with teacher aides, but assessment of student response to paraprofessional counselors remains subjective or tentative. Indigenous nonprofessional guidance workers are likely to be particularly effective in reaching certain members of the school population because they are able to identify more closely with the backgrounds from which these students come and are more familiar with and aware of their unique needs. The paraprofessional can serve as a middleman or agent between the professional and the student, providing a bridge for greater understanding, thereby promoting better communication between professionals and students.

The addition of nonprofessional personnel certainly expands the educational staff and has the effect of providing more individualized, personal attention, less structure in the classroom, and more opportunities for innovative educational experiences for students both in guidance and instruction.

Effects on the School and the Administration

The potential benefits to the school and the administration of employing paraprofessionals are significant and far-reaching. Involving indigenous personnel in educational institutions has the potential for improving school-community relations, making the school more aware of community mores and cultures, improving the relevance of the educational curricula to the needs of the school population, and providing a linkage between the school and community. Nonprofessionals also can help provide solutions to manpower shortages and to the development of a differentiated staffing pattern in the school.

The use of nonprofessionals in education programs is likely to set a climate for change and can be an effective catalyst for evaluating roles and functions of all school personnel, as well as for examining and restructuring curriculum offerings and teaching or counseling practices. Such programs can lead to a coalition of skills and practices whereby a greater level of equality is achieved and organizations become more humane and democratic.

The school must be prepared to deal with numerous factors that relate to the use of nonprofessional workers. These include job advancement opportunities, staff relationships, training, supervison, budgetary considerations, and the like. Clear delineation of responsibility is a first priority for those who administer the paraprofessional program.

Effects on the Community

The expansion of professional areas to include the services of nonprofessionals increases the opportunities of jobs for the poor, offers the chance for integrating the poor into the mainstream of the community, and contributes to their upward mobility. Not only does this involvement contribute to a general raising of the community standard of living, however, it is also a powerful way to increase community participation and to promote effective communication with community members, serving to bridge the cultural gap between community and school.

Such involvement has the potential for achieving improved school-community relations, helping the community to be more aware of problems and needs of the school, satisfying community desires for specific educational programs, and generally providing a liaison between community and school.

"The paraprofessional can serve as a middleman or agent between the professional and the student, providing a bridge for greater understanding, thereby promoting better communication between professionals and students."

Increasingly, members of the community are insisting on participation in the development and implementation of education policies and programs. No longer are they content to sit back and leave education to the professionals—instead, they are demanding to be included in decision-making areas and even in the instructional process. Educational institutions are responding by publicly advertising board meeting agendas, allowing time for input from community representatives, and including lay persons on important educational policy-making committees. The placement of paraprofessionals in educational settings, however, may be the key to answering these demands.

Riessman and Gartner (1969) see the paraprofessional movement, particularly the new careers aspect, as part of the thrust for community control that is occuring throughout society—control not only through participation and involvement as members of school boards or employees of a system but also as persons who have impact on decision-making that provides the potential for enabling them to be in control of themselves and their destinies.

The use of the services of indigenous workers brings the voice of the community inside the institution and allows nonprofessionals to observe the educational process first-hand and to formulate and present new ideas, suggestions, or demands for change. Zimpfer (1971) found that the new teacher aides are following steps in career patterns that will lead to their becoming full-fledged teachers in time, seeing themselves not as part-time volunteers on the fringe of what is happening in education but rather as in training for meaningful employment and as an intergral and important part of the educational process.

Effects on Professional Organizations and at the State Level

Professional organizations have responded to the paraprofessional movement in various ways. In 1968, a report of the National Association of Social Workers (NASW) and the Council of Social Work Education (CSWE) endorsed the new careers concept as a new and important manpower resource. The joint report also recognized the importance of the utilization in such programs of personnel indigenous to the client population (NINC, 1970). From this same report came several recommendations for consideration by those organizations employing nonprofessionals: development of job tasks stemming from clients' needs, opportunity for vertical and horizontal mobility, education for career advancement, development of a team concept of services, and training to enable professionals to work better with paraprofessionals.

The National Education Association (NEA) has adopted a policy statement which encourages the development of support personnel as "one of the most challenging and hopeful advances in modern education," but limits paraprofessional participation in the organization. The American Federation of Teachers (AFT), however, not only supports the movement but has been actively recruiting paraprofessionals as full members of the locals. AFT organizers at the national level have even assisted groups of paraprofessionals to form their own locals. Both organizations are attempting to recruit aides who feel that teachers and aids must support one another, the goal being an increase in solidarity for purposes of negotiation.

A great many problems may arise in the organization and unionization of support personnel according to Gartner and Riessman (1968); however, this unionization would seem to be vital to the building of group solidarity among paraprofessionals. Such solidarity would lend strength and cohesiveness to the paraprofessional movement and assist paraprofessionals in negotiating for specific working conditions such as salary scales and increments; length of workday, week or year; tenure regulations; preservice and inservice training requirements; and prescribed opportunities for advancement on the career ladder.

Few states provide for the licensing of paraprofessionals in education (Bobblitt, 1969). Therefore, it becomes the responsibility of the local school district and the supervisory staff to decide upon qualifications and skills needed for satisfactory job performance and to define the tasks to be peformed by paraprofessionals. Some states have attempted to clarify the legal status of paraprofessionals and to place certain limits on how their services may be utilized. California warns that teacher-aides may not be used to increase pupil-teacher ratios; Georgia law requires the licensing of aides and includes certain rules concerning their employment.

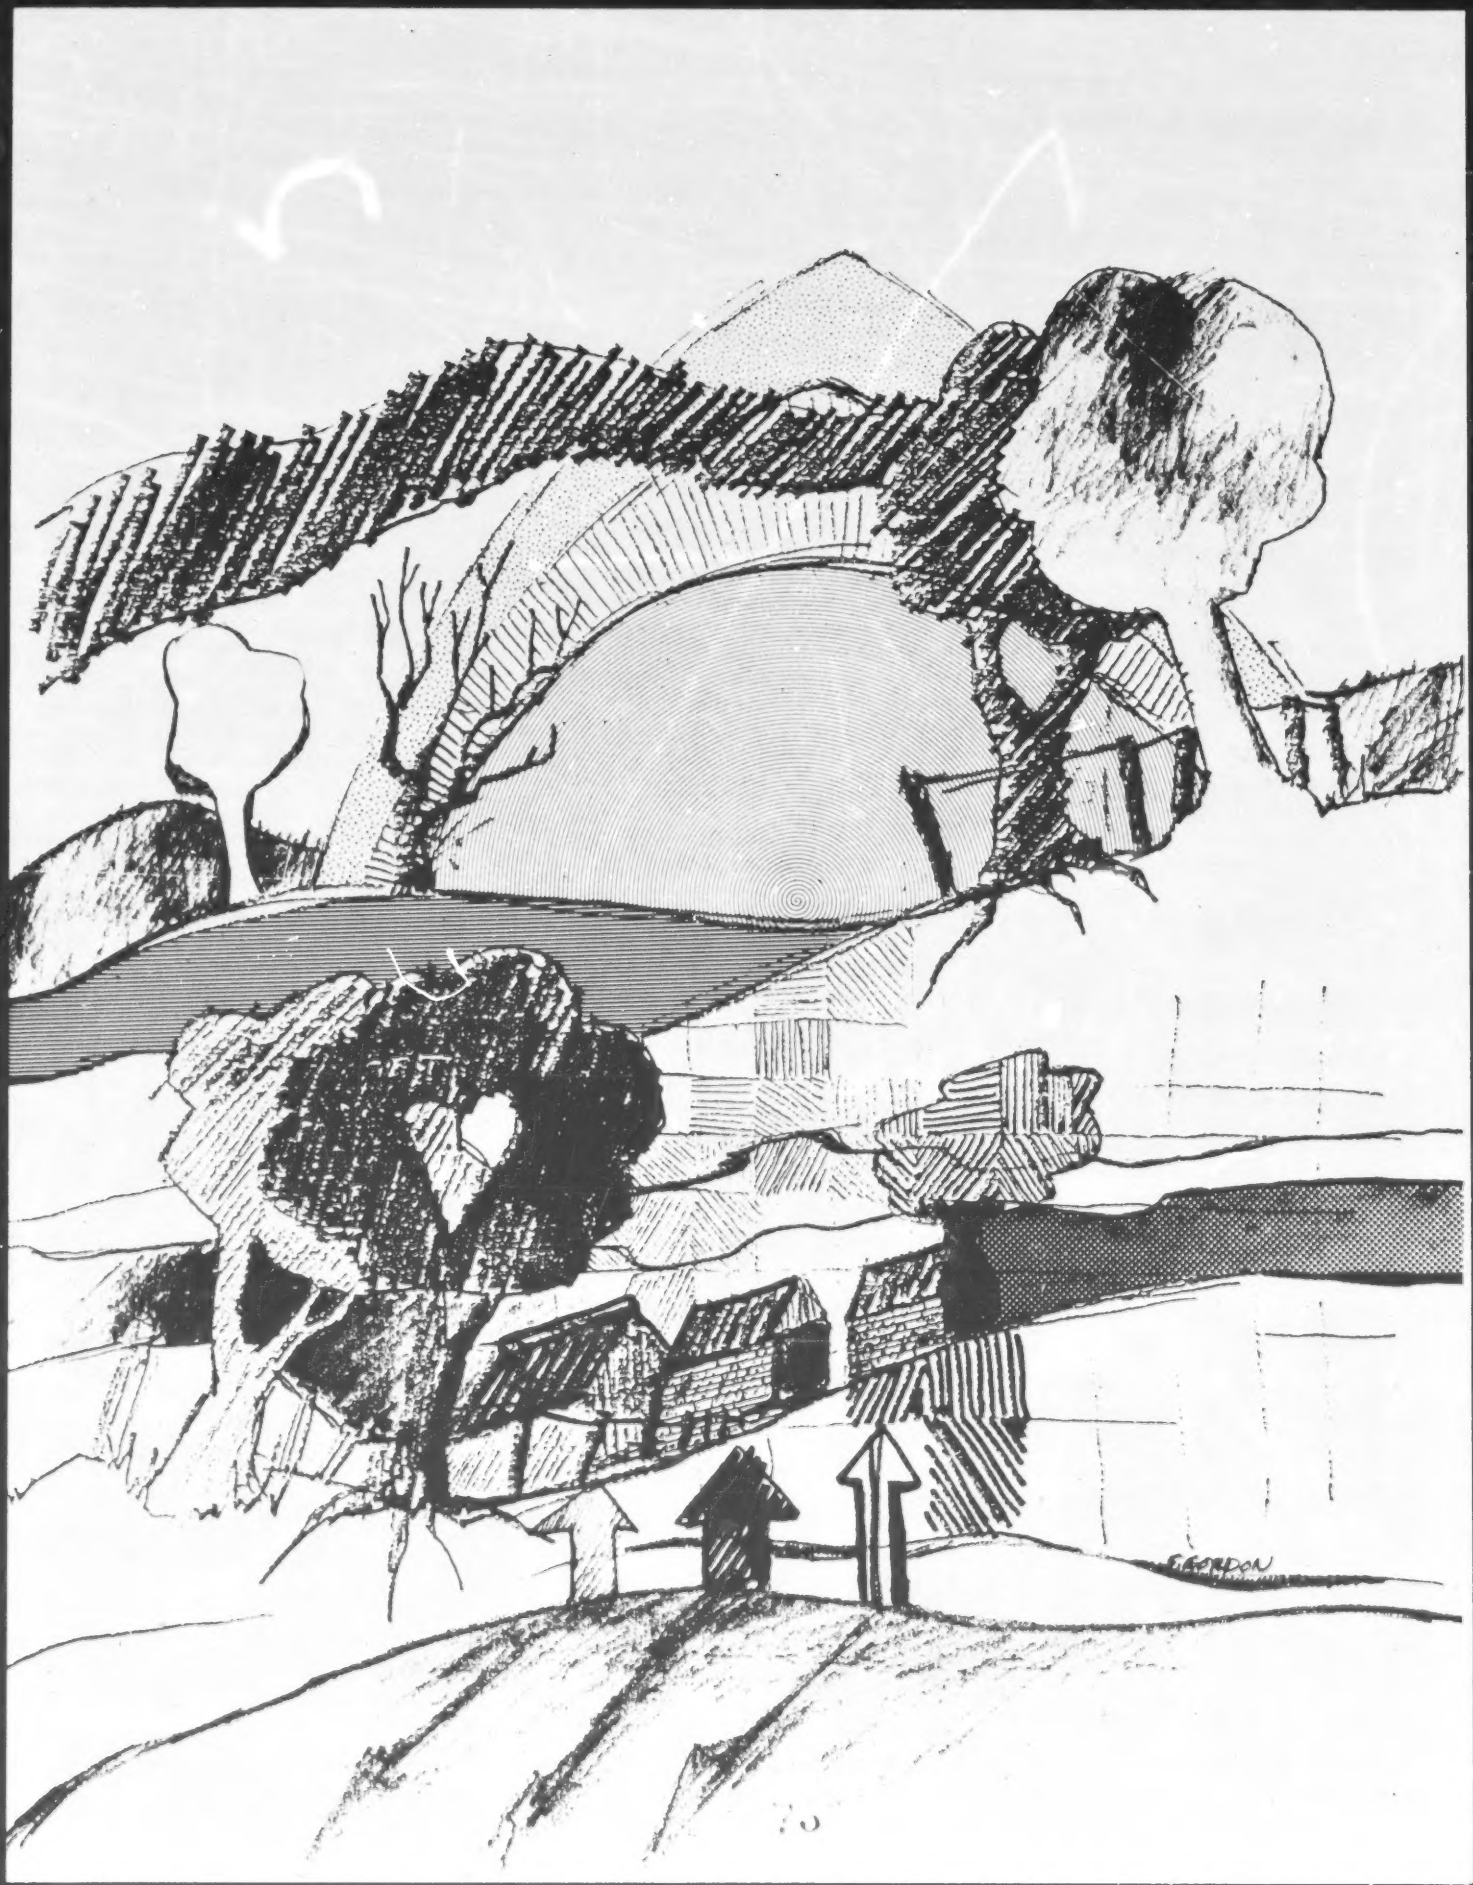
Despite the fact that the paraprofessional movement is relatively new, there is widespread evidence of growing acceptance and institutionalization of paraprofessional programs. An NEA survey of 799 school districts across the country reported that 18% of the paraprofessional programs were funded through state and local funds alone. In Ohio, a 1970 study conducted by the Ohio Education Association revealed that 55% of the paraprofessional programs which were previously federally funded have proved successful enough that local or state governments are willing to provide funds for continued support.

The foregoing list of possible contributions that may be realized through the employment of paraprofessionals is not meant to glorify the role of the paraprofessional, for a number of problems may develop as theory becomes operational. These have been described in an earlier section of this issue and must be taken into consideration if one is to assess the paraprofessional concept fairly and realistically. The fact remains, however, that regardless of the field in which they are employed—be it medicine, law, engineering, government or education—the primary purpose of the use of the services of paraprofessionals is to respond more adequately to the needs of a diversified group of individuals. When incorporated as integral members of a professional staff, they do have the potential for making significant contributions to the educational process.

Future Trends

The future of the paraprofessional movement is difficult to predict. Its direction will depend on such factors as finances, new concepts in education and preparation of professionals, employment patterns, unionization, reciprocal state agreements, and a host of other factors that are not apparent at the present time. The past will also have a direct influence on the path the movement will take in the future, and evaluative studies now underway will have a significant influence on decisions to continue or expand paraprofessional programs.

Lack of funds and swelling ranks of unemployed professionals may cause the movement to slow down or die out. On the other hand, nonprofessionals may be even more in demand in the future due to decreased funding and the resulting inability of school districts to pay for the services of qualified professionals. There is also the possibility that indigenous workers will be employed in even larger numbers as a result of increased community de-



E. GORDON

mands for participation and involvement in the educational process. Possibly the career ladder concept will be abolished in the future, and both professionals and nonprofessionals will be evaluated on a merit system that assesses performance rather than past training or education. The paraprofessional movement may prove to be the impetus for a total revamping of the counseling field, starting with a critical examination of counselor effectiveness, determination of techniques and methods that research shows will contribute to positive change, and a redesign of preparatory programs to include specific skills and practices to accomplish this end. This eventually would have tremendous impact on professionals, persons in training, and the training institutions themselves, for it would mean the downfall of professionalism as we know it now. Professionalism would not be determined by degrees and credits or certification alone, but would be based on the acquisition of prescribed skills and procedures and the recognized ability to use them effectively.

Some uncertainty exists as to whether paraprofessionalism is, or will be, sufficiently unified to be evaluated as a movement. The recency of the implementation of the concept, particularly in pupil personnel services, has not allowed time enough to standardize such things as training, supervision, role definition and evaluation procedures. That the movement has swept the country, however, becomes obvious as in school after school one finds paraprofessionals performing a wide variety of helping functions. Increasing numbers of programs are reporting the results of their use of auxiliary services; and this growing amount of literature, together with actual scientific assessment of program outcomes, is contributing to the movement's becoming a potent force in education.

Gluckstern (1973), a developer of the program to train parents as drug counselors describes a new wave of volunteerism in our society exemplified in what the author calls "community developers." This term is used for workers who are anxious not to compete with or become servants of professionals but to serve their communities in ways that are meaningful and beneficial. In seeking means to accomplish this end, they are needful of skills and competiences that will enable them to participate in those institutions which contribute most directly to the needs of community members—for example, the school. Helping in the classroom is one way of achieving this goal; helping in guidance activities is another. Incorporating these auxiliary workers into the counseling program has the potential for enabling counselors to become more than conveyors of information or test-givers or even helpers to individuals or small groups. Instead, they can become persons who have the potential to mold the thinking and actions of entire communities.

If the paraprofessional concept flourishes and becomes an integral part of pupil personnel services, the counselor will be required in the future to view his role in a broader context. Professionals will be required to participate in the selection process, to design and implement training programs, to supervise and evaluate nonprofessionals. Counselors who firmly believe that individual and small group counseling is the prime reason for their presence in the school may not be able to accept this change. Others may balk at the selection procedure as a task foreign to their personal philosophy of what constitutes sound guidance practice. Still others may frown on the administrative detail required to launch a paraprofessional program. The professional in a volunteer program will surely expand his role to include more consultative functions as he uses his specialized skills and knowledge to assist others to participate effectively in guidance activities. As the only resident pupil personnel specialist working in the majority of the nation's schools, the counselor will have to assume the responsibility for discovering new ways to make the educational experience a positive one for as many children as possible, and counselor training experience will have to include preparation for organizing and facilitating paraprofessional programs.

Incorporating nonprofessionals in counseling offers fascinating possibilities for the professional to explore new dimensions of professional practice, including more time to devote to activities requiring a high level of expertise: consultation with parents, faculty and support personnel; coordination of the personnel in the program; case management; and community liaison activities. Contamination of the support role may occur if aides are employed only as a half-hearted attempt to comply with community pressures and are utilized only for clerical and routine tasks. But if, as the APGA role statement suggests, they are allowed to function at a rather sophisticated level of performance, inclusion of nonprofessionals has the potential for contributing meaningfully to the needs of the community, the school and the students.

The support personnel concept may not be the best method of responding to societal need and may be only a partial solution to problems of money and manpower, but it represents one effort toward revitalizing and expanding human services and, as such, is worthy of careful consideration.

Bazaar

JOURNALS & NEWSLETTERS

Action in Education

Institute for Responsive Education
70 Sachem Street
New Haven, CT (Free)

A newsletter which provides a way for parents, teachers, and administrators to share and exchange ideas and information about citizen action in education.

The Home & School Institute Newsletter

Box 4847 Cleveland Park Station
Washington, D.C. 20008
$6.00 per year (6 issues)

An innovative effort designed to offer a sampler of ideas and materials to bridge the home-school gap and tap the educational goldmine outside the school walls.

IRE Newsletter

70 Sachem Street
New Haven, CT 06520 (free)

The Institute for Responsive Education's quarterly newsletter which focuses on IRE's work with assisting and studying citizen participation in education.

Resources

Box 490
Somerville, MA 02144
Free copy available on request. $5.00/year.

A newsletter about changing needs and aspirations, new ideas, products, services and people.

Siecus Report

Behavioral Publications
72 Fifth Avenue
New York, NY 10011 $9.00

An informative newsletter on human sexuality. Each issue provides in-depth reviews of new professional and general books, films, curricular material, and journal articles concerning sex education, sex research, and sex counseling.

BOOKS

Creative Programming For Older Adults: A Leadership Training Guide

Florence E. Vickery
Association Press
New York $12.95

This book is directed to counselors and others who will be in the position of providing supportive services for the aged.

"Everything Is Fine Now That Leonard Isn't Here..."

L.J. Stoppleworth 1973, 240 pp., SBN 8422-0316-8 $5.00 (paper)

For the teachers who must deal with "Leonards" throughout their careers this book of readings deals with the management of disturbing classroom behavior.

Group Procedures For Counselors In Educational And Community Settings

Richard J. Mainati and Edward L. Trembly 1974, 249pp., 8422-0385-0 $6.25 (paper)

Providing a broad overview of group counseling today this book includes stategies, procedures, and specific group techniques for the use with children, adolescents, adults and groups from culturally different backgrounds.

Management Of the Dying Patient And His Family

Papers by Nathan Schnaper, J.W. Annis, Lawrence J. Roose, et al. 1974, 197 pp. SBN 8422-7148-1. $15.00

The emotional reactions and fears of the dying patient and his family, as well as the emotional factors which complicate the professional's response to the terminally ill are explored along with the special problem of communicating with the dying patient.

The above three books may be ordered from

MSS Information Service
655 Madison Avenue
New York, NY 10021

Bets Wishs Doc

Dr. Martin E. Cohen and Barbara Davidson Arthur
Fields Books (Dutton, dist.) $7.95

Directing his message to parents and teachers of children with perceptual handicaps, Dr. Cohen describes the plight of these children and the methods he has used to effect perceptual retraining.

Competency Based Learning: Technology, Management and Design

Ivor K. Davies McGraw-Hill $9.95

A systematic approach to task analysis, writing objectives, movitivation and implementing planned teaching strategies.

Developing Observation Skills

Carol A. Cartwright & G. Philip Cartwright
McGraw-Hill $3.95

A practical guide to observation as a means of gathering information needed to make instructional decisions in pre-school, elementary and special classes. This unique text concentrates on "how to do it" information and provides valuable suggestions for reducing error in observation.

Families and Family Therapy

Dr. Salvador Minuchin
Harvard University Press
79 Garden Street, Cambridge, MA 02138 $10.00

Dr. Minuchin describes methods of diagnosing or "mapping" problems of the troubled family and determining appropriate therapeutic goals and strategies. Extended families, families with parental child, and families in transitional situations are examined.

Financial Aids For Higher Education

Oregon Keeslar
Wm. C. Brown Company
2640 Kerper Blvd.
Dubuque, IA 52001 $13.95

An excellent information source addressed to parents, counselors, and most importantly to college bound students seeking scholarships, grants or loans. More than 2500 aid programs are listed.

New Dimensions In Adoption

Florence Rondell and Anne-Marie Murray Crown Publishers, Inc. $5.95

This book focuses on the needs of children who would have been considered unsuitable for adoption a few years ago, the handicapped, the emotionally disturbed, the orphans of war and other special cases.

Requirements For Certification for Elementary Schools, Secondary Schools, Jr. Colleges
39th Edition 1974-75

Elizabeth H. Woellner
The University of Chicago Press
5801 Ellis Avenue
Chicago, IL 60637 $10.50

This volume contains a state by state listing of detailed information on certification requirements for elementary and secondary teachers, administrators, guidance personnel, special education teachers, and other area specialists. This would be a valuable addition to any library serving practicing and potential school personnel.

The Unmarried Man

George Gilder
Harper & Row, Inc. $7.95

A study of what is happening to single men in our society and what the decline in the standard of monogamy means to men's lives and to society as a whole.

What Color Is Your Parachute? A Practical Manual for Job-Hunters and Career Changers

Richard Nelson Bolles
Ten Speed Press
Post Office Box 4310
Berkeley, CA 94704
$7.95 (revised ed. 1974)

Useful as a sourcebouk for placement counselors and invaluable to the individual job seeker this book tells how to identify what you want to do with the rest of your life, how to locate the job you want, and how to convince the employer you are the best person for the job.

RESOURCES

"CIRCUS: Getting Behind the Numbers"

Box 2814
Educational Testing Service
Princeton, NJ 08540
Free explanatory booklet; CIRCUS specimen set $3.50

A series of tests in booklet form to help the teacher of young children pinpoint learning strengths and weaknesses. Called CIRCUS, the program's format of clowns, balloons, animals and the circus train overcome such problems as the range of children's verbal development and ethnic diversity.

Consciousness Razors

By Verne Moberg
The Feminist Press
P.O. Box 334
Old Westbury, [illegible] 11568
20¢ each or 10 for $1.00 plus business size stamped envelope

Twelve incisive reality tests for the role that sex stereotypes play in our lives.

Directory of College Programs for Paraprofessionals

Behavioral Publications
72 Fifth Avenue
New York City 10011 $9.95

Developed from a study supported by an Exxon Foundation grant, this sourcebook lists nearly 1000 colleges offering degree programs for paraprofessionals.

Directory of Organizations and Personnel in Educational Management, 1974 edition

ERIC Clearinghouse for Educational Management
University of Oregon
Eugene, OR 97403 $3.50

This directory provides access to research on all aspects of educational management and facilities. Both organizational and personnel sections are supplemented by extensive subject indexes.

High School Feminist Studies

Eds. Carol Ahlum and Jacqueline M. Frailey
The Clearinghouse on Women's Studies
The Feminist Press
Box 334
Old Westbury, NY 11568 $2.50 plus 50¢ postage & handling

A recently published collection of high school course syllabi, bibliographies and materials.

Idea Exchange

LINC Idea Exchange
800 Silver Avenue
Greensboro, NC 27403
$1.00 per booklet

A thick quarterly publication in booklet form, each issue focusing on a particular subject. **Native Americans,** issued last fall contains a wide range of material for teachers of American Indian children, including curriculum ideas, resource lists, etc. **If A Child Sees a Mountain,** the most recent booklet is directed to techers of handicapped preschoolers. Other publications planned include a guide for parent involvement and a nutrition information booklet.

Teenagers and Alcohol

Current Awareness Services
National Clearinghouse for Alcohol Information
P.O. Box 2345
Rockville, MD 20852

This is number 8 of 15 annotated bibliographies in a series dealing with the general topic of Sociocultural Aspects of Alcohol Use and Alcoholism. Information on other services of the Clearinghouse is also available from the above address.

The Use and Evaluation of Interest Inventories and Simulations

John L. Holland
Johns Hopkins University
Baltimore, MD 21218
Free (single copy)

General perspective for evaluating interest inventories and simulations is provided. Activities to stimulate development of more useful inventories are outlined.

Value Exploration Through Role-Playing

ERA Press
Box 767
Amherst, MA 01002 ($2.95)

A useful handbook for classroom teachers and guidance counselors who may wish to use role-playing in conjunction with exploring and clarifying values, group counseling or behavior control. Includes many secific formats for role-playing and procedures for implementation with junior or senior high school students.

Zephyros Education Exchange

1201 Stanyan
San Francisco, CA 94117

A non-profit collaborative of San Francisco teachers, parents, and artists through which they share ideas that they create and use in their classrooms. Their membership is limited, but for a $10 membership fee they will place you on a waiting list and send you a collection of Z material so that you can start your own exchange.

REPORTS

Alternatives To Drug Abuse: Steps Toward Prevention

This publication introduces and describes new efforts to move people away from drugs based on the general idea of alternatives to drug abuse. 1973 36 pp. HE 20.8202:D 84 S/N 1724-00344 70¢

Educational Uses of Cable Television

Attn: Information Group
Cable Television Information Center
2100 M Street, NW
Washington, D.C. 20037 ($2.50)

As part of a Special Report Series on CATV this report contains suggestions and examples of how to use cable access channels to reach "nontraditional" and traditional students at the high school and higher ed. levels. Other features of the report include a list of 21 Federal Programs through which funds for cable-related education might be available; a list of sources of pre-recorded educational programming; and a discussion of the "more exotic ideas" such as dial-a-program and two-way television.

Job Satisfaction: Is There A Trend?

Major trends and changes in workers' attitudes over the last ten years are included in this report prepared by the department of Labor's Manpower Administration to answer questions in the field of workers' job satisfaction. 1974 57 pp. L 1.39/3:30 S/N 2900-00195 95¢

Personnel Evaluation In Vocational and Technical Education

A guidebook designed for local and state administrators, teachers, program managers, and others responsible for evaluating personnel in vocational education. Explains the rationale, procedures and purposes of personnel evaluation. 1973 34 pp. HE 5.3:P 43/4 S/N 1780-01267 75¢

Positive Approaches To Dropout Prevention

This detailed report describes some of the successful educational practices which have decreased the school dropout rate in target schools over a four year period. 1973 94 pp. HE 5.2:D 83 S/N 1780-01214 $1.20

Promoting Mental Health In The Classroom, A Handbook For Teachers

A handbook developed to help teachers (elementary or secondary) promote an understanding approach to human behavior in their classrooms. Rep. 1973 94 pp. HE 20.8108:C 56 S/N 1724-00286 $1.25

The Residential Center: Corrections In The Community

Community-based, small residential centers are discussed as alternatives to the large hospital or prison as a bridge back to the community. 1973 26 pp. J 16.2:R 31/973 S/N 2705-00002 40¢

Teenage Delinquency in Small Town American Research Report No. 5

NIMH Center for Studies of Crime and Delinquency
5600 Fishers Lane
Rockville, MD 20852

The idea that delinquency is much more common among kids in the big city than in those small towns is is not borne out by this recent NIMH research report.

Transitional Volunteering: Steps Toward Mental Health

Isolde chapin Winberg (ed.)
NCVA Clearinghouse
Washington, D.C.
1st copy free-others $1.00

A notebook of volunteer work undertaken by mental patients as part of their efforts to restructure their lives. A large share of the material is excerpted from a report on the Transitional Volunteer Project inaugurated by the Volunteer Bureau/VAC in Burlingame, CA., including a step-by-step outline of development of the San Mateo program.

Order the above documents from Public Documents Distribution Center 5801 Tabor Avenue Philadelphia, PA 19120 (Make checks payable to Supt. of Documents)

MISCELLANEOUS

Interfuture
535 Fifth Avenue
Suite 3103
Nev. York, NY 10017

A non-profit educational program that offers select undergraduates the opportunity to design and conduct cross-cultural study projects in North America, Europe and/or a Third World nation.

Metric System

"Dixie" Cups available from the American Can Company for schools feature information on the metric system.

Important Notice for EDRS Users
New EDRS Ordering Instructions

The ERIC Document Reproduction Service (EDRS) has a new home. It is now operated by Computer Microfilm International, Corp. To the users and subscribers of EDRS this new arrangement will have two advantages: a decrease in the price of microfiche and a faster turn around tme for filling orders (about 1 week).

Although the procedure for ordering ERIC docments will remain substantially the same, there are a few important changes. The first of these is the new address. All requests for ERIC documents should be sent to EDRS, P.O. Box 190, Arlington, VA 22210. Always order by ED number and specify the type of reproduction required—paper copy (HC) or microfiche (MF)—and the number of copies wanted. All orders must be in writing and must be accompanied by full payment, including postage.

The price of microfiche is $0.75 for the first five and $0.15 for each additional fiche. The postage is $0.18 for up to 60 microfiche and $0.08 for each additional 60 fiche. The price of paper copy is $1.50 for the first 25 pages, $1.85 for 26-50 pages, $3.15 for 51-75 pages, $4.20 for 76-100 pages, and $1.20 for each additional 25 pages above 100. The postage is $0.18 for the first 60 pages and $0.08 for each additional 60 pages.

ERIC believes this change will result in improved service to all EDRS users.
